# Product Change Notification - SYST-21CBJU083

**Date:**

25 Jun 2018

**Product Category:**

32-bit PIC Microcontrollers

**Affected CPNs:**

**Notification subject:**

Data Sheet - PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family Data Sheet Document Revision

**Notification text:**

SYST-21CBJU083

Microchip has released a new DeviceDoc for the PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family of devices. If you are using one of these devices please read the document located at PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family.

**Notification Status:** Final

**Description of Change:**

This revision includes the following major changes, which are referenced by their respective chapter in Table C-4.

In addition, minor updates to text and formatting were incorporated throughout the document.

| SectionName | UpdateDescription |
|---|---|
| TABLE 1: "PIC32MZ EF Family<br><br>Features" | 144-Lead TFBGA package information was added |
| TABLE 6: "Pin Names for 144-pinDevices" | Table was added to describe the Pin Names and locations for the 144-Lead TFBGA package. |
| TABLE 1-1: "ADC Pinout I/O<br><br>Descriptions"through Table 1-22: "JTAG, Trace, and Programming/Debugging PinoutI/O Descriptions" | 144-Lead TFBGA Package Information was added. |
| 2.11 "Considerations when Interfacing to Remotely PoweredCircuits" | This section was added which provides some issues to consider when interfacing the PIC32MZ to circuits using an independent power source. |
| 28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-DigitalConverter (ADC)" | Information relating to initialization and interleaved operation and charge pump usage are added to aid in throughput calculation. |
| Register 34-10: "CFGPG: Permission Group ConfigurationRegister" | A note was added to provide assistance in setting the CPU group permission value. |
| 37.1 "DC Characteristics" | 144-Lead TFBGA package thermal information was added. |
| 41.0 "Packaging Information" | 144-Lead TFBGA package information was added. |

| | |
|---|---|
| **Product Identification System** | 144-Lead TFBGA package thermal information was added. |

**Impacts to Data Sheet:** None

**Reason for Change:** To Improve Manufacturability

**Change Implementation Status:** Complete

**Date Document Changes Effective:** 25 Jun 2018

**NOTE:** Please be advised that this is a change to the document only the product has not been changed.

**Markings to Distinguish Revised from Unrevised Devices:** N/A

**Terms and Conditions:**

If you wish to change your product/process change notification (PCN) profile please log on to our website at http://www.microchip.com/PCN sign into myMICROCHIP to open the myMICROCHIP home page, then select a profile option from the left navigation bar.

To opt out of future offer or information emails (other than product change notification emails), click here to go to microchipDIRECT and login, then click on the "My account" link, click on "Update profile" and un-check the box that states "Future offers or information about Microchip's products or services."

# PIC32MZ Embedded Connectivity with Floating Point Unit (EF) Family

## 32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog

### Operating Conditions

- 2.1V to 3.6V, -40ºC to +85ºC, DC to 252 MHz
- 2.1V to 3.6V, -40ºC to +125ºC, DC to 180 MHz

### Core: 252 MHz (up to 415 DMIPS) M-Class

- 16 KB I-Cache, 4 KB D-Cache
- FPU for 32-bit and 64-bit floating point math
- MMU for optimum embedded OS execution
- microMIPS™ mode for up to 35% smaller code size
- DSP-enhanced core:
  - Four 64-bit accumulators
  - Single-cycle MAC, saturating, and fractional math
  - IEEE 754-compliant
- Code-efficient (C and Assembly) architecture

### Clock Management

- Programmable PLLs and oscillator clock sources
- Fail-Safe Clock Monitor (FSCM)
- Independent Watchdog Timers (WDT) and Deadman Timer (DMT)
- Fast wake-up and start-up

### Power Management

- Low-power modes (Sleep and Idle)
- Integrated Power-on Reset (POR) and Brown-out Reset (BOR)

### Memory Interfaces

- 50 MHz External Bus Interface (EBI)
- 50 MHz Serial Quad Interface (SQI)

### Audio and Graphics Interfaces

- Graphics interfaces: EBI or PMP
- Audio data communication: $I^2S$, LJ, and RJ
- Audio control interfaces: SPI and $I^2C$
- Audio master clock: Fractional clock frequencies with USB synchronization

### High-Speed (HS) Communication Interfaces (with Dedicated DMA)

- USB 2.0-compliant Hi-Speed On-The-Go (OTG) controller
- 10/100 Mbps Ethernet MAC with MII and RMII interface

### Security Features

- Crypto Engine with RNG for data encryption/decryption and authentication (AES, 3DES, SHA, MD5, and HMAC)
- Advanced memory protection:
  - Peripheral and memory region access control

### Direct Memory Access (DMA)

- Eight channels with automatic data size detection
- Programmable Cyclic Redundancy Check (CRC)

### Advanced Analog Features

- 12-bit ADC module:
  - 18 Msps with up to six Sample and Hold (S&H) circuits (five dedicated and one shared)
  - Up to 48 analog inputs
  - Can operate during Sleep and Idle modes
  - Multiple trigger sources
  - Six Digital Comparators and six Digital Filters
- Two comparators with 32 programmable voltage references
- Temperature sensor with ±2ºC accuracy

### Communication Interfaces

- Two CAN modules (with dedicated DMA channels):
  - 2.0B Active with DeviceNet™ addressing support
- Six UART modules (25 Mbps):
  - Supports up to LIN 2.1 and IrDA® protocols
- Six 4-wire SPI modules (up to 50 MHz)
- SQI configurable as an additional SPI module (50 MHz)
- Five $I^2C$ modules (up to 1 Mbaud) with SMBus support
- Parallel Master Port (PMP)
- Peripheral Pin Select (PPS) to enable function remap

### Timers/Output Compare/Input Capture

- Nine 16-bit or up to four 32-bit timers/counters
- Nine Output Compare (OC) modules
- Nine Input Capture (IC) modules
- Real-Time Clock and Calendar (RTCC) module

### Input/Output

- 5V-tolerant pins with up to 32 mA source/sink
- Selectable open drain, pull-ups, pull-downs, and slew rate controls
- External interrupts on all I/O pins
- PPS to enable function remap

### Qualification and Class B Support

- AEC-Q100 REVH (Grade 1 -40ºC to +125ºC)
- Class B Safety Library, IEC 60730 (planned)
- Back-up internal oscillator

### Debugger Development Support

- In-circuit and in-application programming
- 4-wire MIPS® Enhanced JTAG interface
- Unlimited software and 12 complex breakpoints
- IEEE 1149.2-compatible (JTAG) boundary scan
- Non-intrusive hardware-based instruction trace

### Software and Tools Support

- C/C++ compiler with native DSP/fractional and FPU support
- MPLAB® Harmony Integrated Software Framework
- TCP/IP, USB, Graphics, and mTouch™ middleware
- MFi, Android™, and Bluetooth® audio frameworks
- RTOS Kernels: Express Logic ThreadX, FreeRTOS™, OPENRTOS®, Micriμm® μC/OS™, and SEGGER embOS®

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

**http://www.microchip.com**

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; **http://www.microchip.com**
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### Customer Notification System

Register on our web site at **www.microchip.com** to receive the most current information on all of our products.

## 1.0 DEVICE OVERVIEW

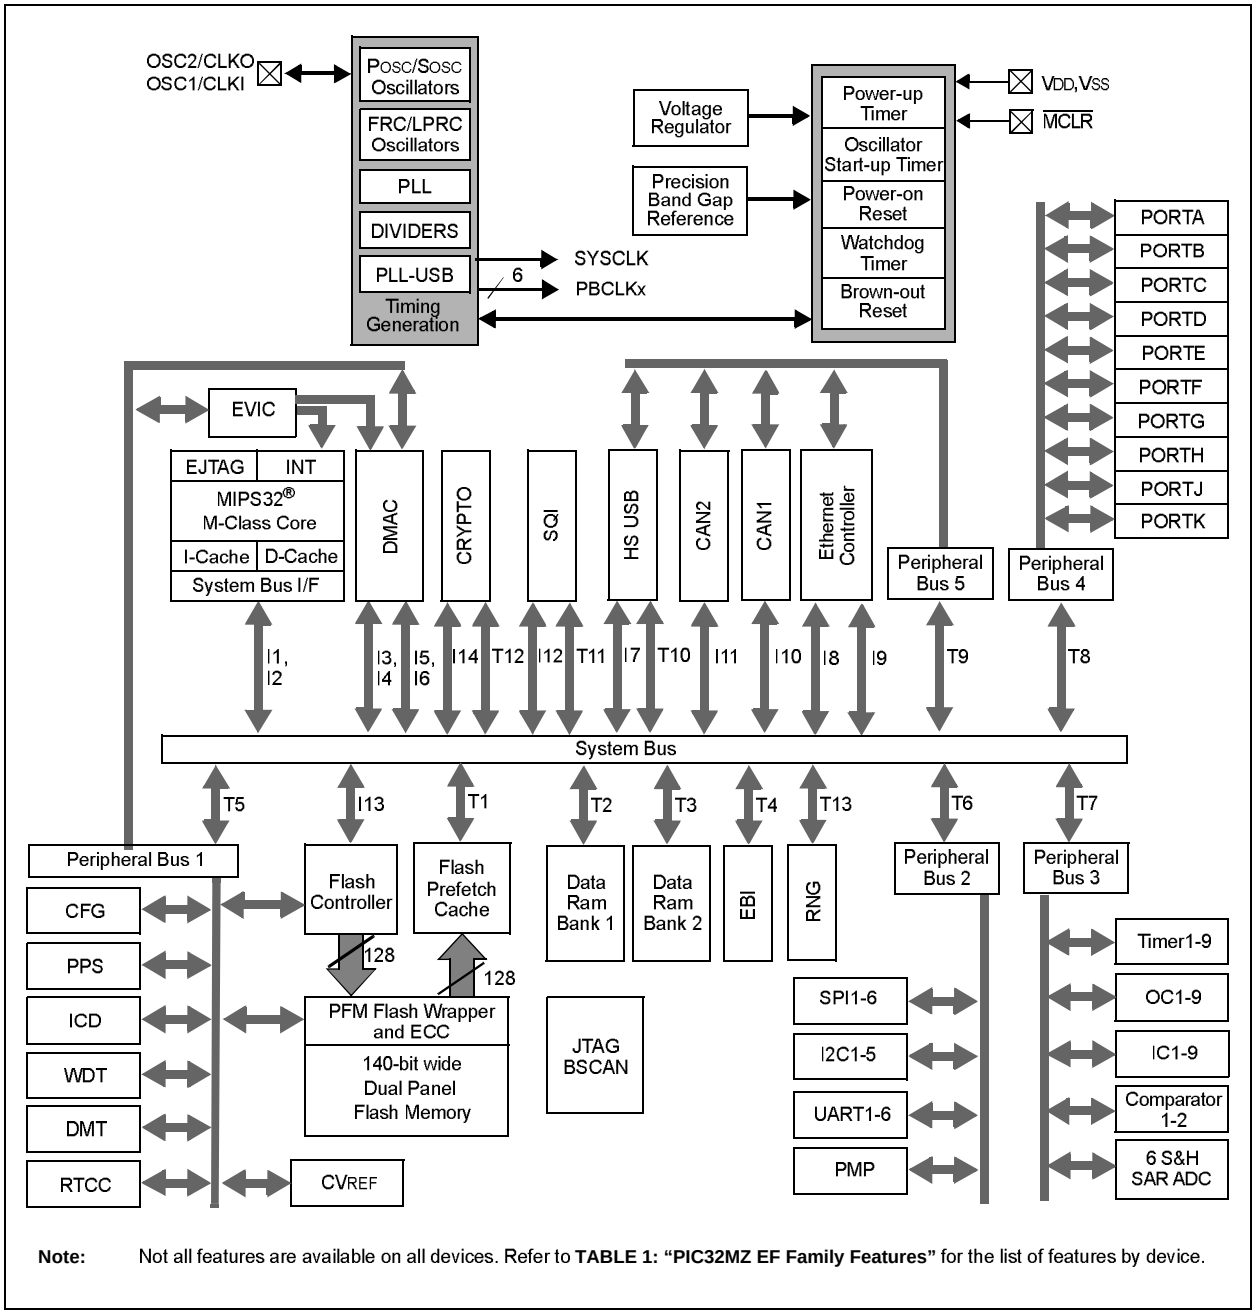

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

This data sheet contains device-specific information for PIC32MZ EF devices.

Figure 1-1 illustrates a general block diagram of the core and peripheral modules in the PIC32MZ EF family of devices.

Table 1-21 through Table 1-22 list the pinout I/O descriptions for the pins shown in the device pin tables (see Table 2 through Table 5).

**FIGURE 1-1: PIC32MZ EF FAMILY BLOCK DIAGRAM**

**Note:** Not all features are available on all devices. Refer to **TABLE 1: "PIC32MZ EF Family Features"** for the list of features by device.

# 2.0 GUIDELINES FOR GETTING STARTED WITH 32-BIT MICROCONTROLLERS

**Note 1:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

## 2.1 Basic Connection Requirements

Getting started with the PIC32MZ EF family of 32-bit Microcontrollers (MCUs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see **2.2 "Decoupling Capacitors"**)
- All AVDD and AVSS pins, even if the ADC module is not used (see **2.2 "Decoupling Capacitors"**)
- $\overline{\text{MCLR}}$ pin (see **2.3 "Master Clear (MCLR) Pin"**)
- PGECx/PGEDx pins, used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see **2.4 "ICSP Pins"**)
- OSC1 and OSC2 pins, when external oscillator source is used (see **2.7 "External Oscillator Pins"**)

The following pin(s) may be required as well:

VREF+/VREF- pins, used when external voltage reference for the ADC module is implemented.

**Note:** The AVDD and AVSS pins must be connected, regardless of ADC use and the ADC voltage reference source.

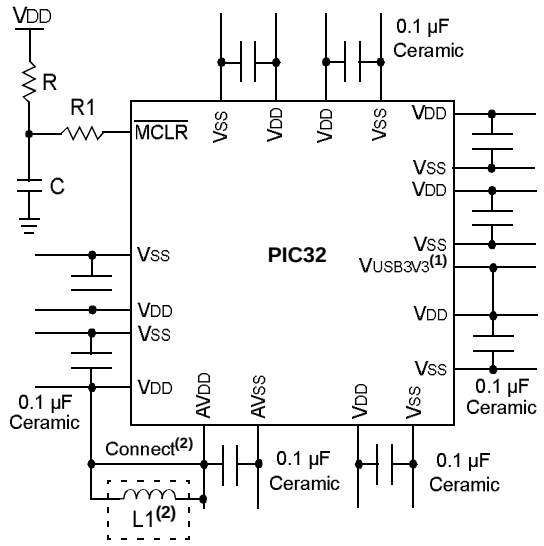

## 2.2 Decoupling Capacitors

The use of decoupling capacitors on power supply pins, such as VDD, VSS, AVDD and AVSS is required. See Figure 2-1.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** A value of 0.1 µF (100 nF), 10-20V is recommended. The capacitor should be a low Equivalent Series Resistance (low-ESR) capacitor and have resonance frequency in the range of 20 MHz and higher. It is further recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended that the capacitors be placed on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high frequency noise:** If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 µF to 0.001 µF. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 µF in parallel with 0.001 µF.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

**FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION**

**Note 1:** If the USB module is not used, this pin must be connected to VSS. When connected to VSS, the shared pin functions on USBID will not be available.

**2:** As an option, instead of a hard-wired connection, an inductor (L1) can be substituted between VDD and AVDD to improve ADC noise rejection. The inductor impedance should be less than 1Ω and the inductor capacity greater than 10 mA.

Where:

$$f \quad \frac{FCNV}{2} \quad \text{(i.e., ADC conversion rate/2)}$$

$$f \quad \frac{1}{(2\pi\sqrt{LC})}$$

$$L \quad \left(\frac{1}{(2\pi f\sqrt{C})}\right)^2$$

### 2.2.1 BULK CAPACITORS

The use of a bulk capacitor is recommended to improve power supply stability. Typical values range from 4.7 µF to 47 µF. This capacitor should be located as close to the device as possible.

## 2.3 Master Clear ($\overline{\text{MCLR}}$) Pin

The $\overline{\text{MCLR}}$ pin provides for two specific device functions:

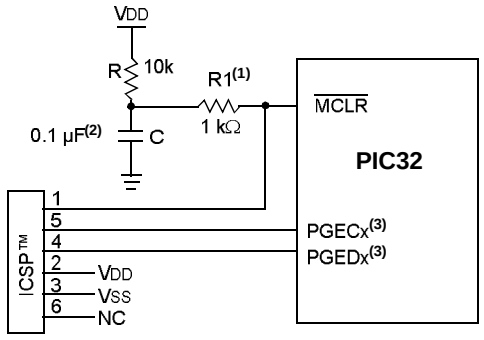

- Device Reset
- Device programming and debugging

Pulling The $\overline{\text{MCLR}}$ pin low generates either a device Reset or a POR, depending on the setting of the SMCLR bit (DEVCFG0<15>). Figure 2-2 illustrates a typical $\overline{\text{MCLR}}$ circuit. During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{\text{MCLR}}$ pin. Consequently, specific voltage levels (VIH and VIL) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as illustrated in Figure 2-2, it is recommended that the capacitor C be isolated from the $\overline{\text{MCLR}}$ pin during programming and debugging operations.

Place the components illustrated in Figure 2-2 within one-quarter inch (6 mm) from the $\overline{\text{MCLR}}$ pin.

**FIGURE 2-2: EXAMPLE OF $\overline{\text{MCLR}}$ PIN CONNECTIONS**

**Note 1:** 470Ω ≤ R1 ≤ 1kΩ will limit any current flowing into $\overline{\text{MCLR}}$ from the external capacitor C, in the event of $\overline{\text{MCLR}}$ pin breakdown, due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the $\overline{\text{MCLR}}$ pin VIH and VIL specifications are met without interfering with the Debug/Programmer tools.

**2:** The capacitor can be sized to prevent unintentional Resets from brief glitches or to extend the device Reset period during POR.

**3:** No pull-ups or bypass capacitors are allowed on active debug/program PGECx/PGEDx pins.

© 2015-2018 Microchip Technology Inc.

## 2.4 ICSP Pins

The PGECx and PGEDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input low (VIL) requirements.

Ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® ICD 3 or MPLAB REAL ICE™.

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available from the Microchip web site.

- *"Using MPLAB® ICD 3"* (poster) (DS50001765)
- *"MPLAB® ICD 3 Design Advisory"* (DS50001764)
- *"MPLAB® REAL ICE™ In-Circuit Debugger User's Guide"* (DS50001616)
- *"Using MPLAB® REAL ICE™ Emulator"* (poster) (DS50001749)

## 2.5 JTAG

The TMS, TDO, TDI and TCK pins are used for testing and debugging according to the Joint Test Action Group (JTAG) standard. It is recommended to keep the trace length between the JTAG connector and the JTAG pins on the device as short as possible. If the JTAG connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the TMS, TDO, TDI and TCK pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input voltage low (VIL) requirements.

## 2.6 Trace

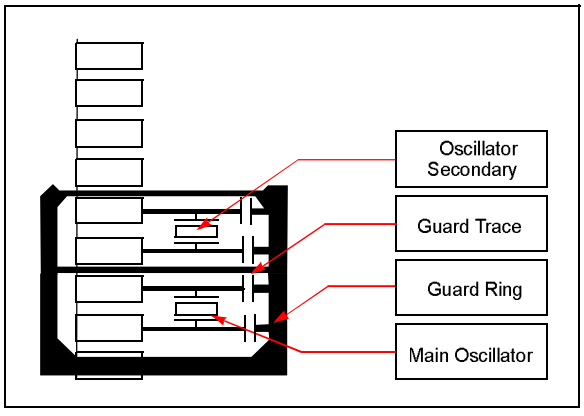

The trace pins can be connected to a hardware trace-enabled programmer to provide a compressed real-time instruction trace. When used for trace, the TRD3, TRD2, TRD1, TRD0 and TRCLK pins should be dedicated for this use. The trace hardware requires a 22 Ohm series resistor between the trace pins and the trace connector.

## 2.7 External Oscillator Pins

Many MCUs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 8.0 "Oscillator Configuration"** for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is illustrated in Figure 2-3.

**FIGURE 2-3: SUGGESTED OSCILLATOR CIRCUIT PLACEMENT**

## 2.8 Unused I/Os

Unused I/O pins should not be allowed to float as inputs. They can be configured as outputs and driven to a logic-low state.

Alternatively, inputs can be reserved by connecting the pin to VSS through a 1k to 10k resistor and configuring the pin as an input.

## 2.9 Designing for High-Speed Peripherals

The PIC32MZ EF family devices have peripherals that operate at frequencies much higher than typical for an embedded environment. Table 2-1 lists the peripherals that produce high-speed signals on their external pins:

**TABLE 2-1: PERIPHERALS THAT PRODUCE HS SIGNALS ON EXTERNAL PINS**

| Peripheral | High-Speed Signal Pins | Maximum Speed on Signal Pin |
|---|---|---|
| EBI | EBIAx, EBIDx | 50 MHz |
| SQI1 | SQICLK, SQICSx, SQIDx | 50 MHz |
| HS USB | D+, D- | 480 MHz |

Due to these high-speed signals, it is important to consider several factors when designing a product that uses these peripherals, as well as the PCB on which these components will be placed. Adhering to these recommendations will help achieve the following goals:

- Minimize the effects of electromagnetic interference to the proper operation of the product
- Ensure signals arrive at their intended destination at the same time
- Minimize crosstalk
- Maintain signal integrity
- Reduce system noise
- Minimize ground bounce and power sag

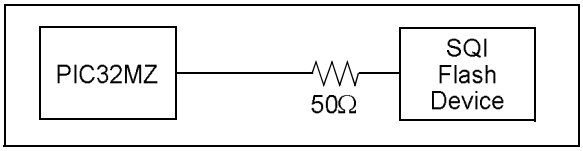

### 2.9.1 SYSTEM DESIGN

#### 2.9.1.1 Impedance Matching

When selecting parts to place on high-speed buses, particularly the SQI bus, if the impedance of the peripheral device does not match the impedance of the pins on the PIC32MZ EF device to which it is connected, signal reflections could result, thereby degrading the quality of the signal.

If it is not possible to select a product that matches impedance, place a series resistor at the load to create the matching impedance. See Figure 2-4 for an example.

**FIGURE 2-4: SERIES RESISTOR**

#### 2.9.1.2 PCB Layout Recommendations

The following list contains recommendations that will help ensure the PCB layout will promote the goals previously listed.

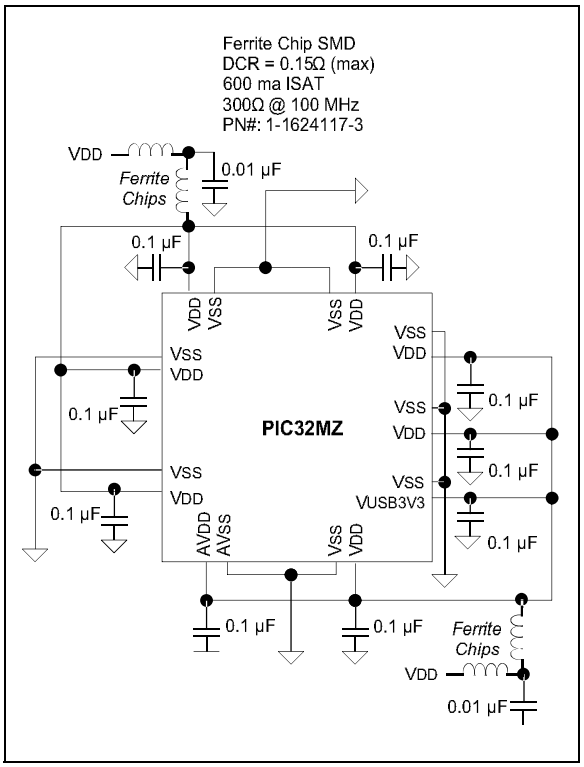

- **Component Placement**
  - Place bypass capacitors as close to their component power and ground pins as possible, and place them on the same side of the PCB
  - Devices on the same bus that have larger setup times should be placed closer to the PIC32MZ EF device
- **Power and Ground**
  - Multi-layer PCBs will allow separate power and ground planes
  - Each ground pin should be connected to the ground plane individually
  - Place bypass capacitor vias as close to the pad as possible (preferably inside the pad)
  - If power and ground planes are not used, maximize width for power and ground traces
  - Use low-ESR, surface-mount bypass capacitors
- **Clocks and Oscillators**
  - Place crystals as close as possible to the PIC32MZ EF device OSC/SOSC pins
  - Do not route high-speed signals near the clock or oscillator
  - Avoid via usage and branches in clock lines (SQICLK)
  - Place termination resistors at the end of clock lines
- **Traces**
  - Higher-priority signals should have the shortest traces
  - Match trace lengths for parallel buses (EBIAx, EBIDx, SQIDx)
  - Avoid long run lengths on parallel traces to reduce coupling
  - Make the clock traces as straight as possible
  - Use rounded turns rather than right-angle turns
  - Have traces on different layers intersect on right angles to minimize crosstalk
  - Maximize the distance between traces, preferably no less than three times the trace width
  - Power traces should be as short and as wide as possible
  - High-speed traces should be placed close to the ground plane

### 2.9.1.3 EMI/EMC/EFT (IEC 61000-4-4 and IEC 61000-4-2) Suppression Considerations

The use of LDO regulators is preferred to reduce overall system noise and provide a cleaner power source. However, when utilizing switching Buck/Boost regulators as the local power source for PIC32MZ EF devices, as well as in electrically noisy environments or test conditions required for IEC 61000-4-4 and IEC 61000-4-2, users should evaluate the use of T-Filters (i.e., L-C-L) on the power pins, as shown in Figure 2-5. In addition to a more stable power source, use of this type of T-Filter can greatly reduce susceptibility to EMI sources and events.

**FIGURE 2-5: EMI/EMC/EFT SUPPRESSION CIRCUIT**

## 2.10 Typical Application Connection Examples

Examples of typical application connections are shown in Figure 2-8 and Figure 2-9.

## 2.11 Considerations when Interfacing to Remotely Powered Circuits

### 2.11.1 NON-5V TOLERANT INPUT PINS

A quick review of the section "Absolute Maximum Rating" in Electrical Characteristics chapter indicates that the voltage on any non-5V tolerant pin may not exceed $V_{DD}$ + 0.3V. The exception is, if the input current is limited to meet the respective injection current specifications defined by the parameters, such as DI60a, DI60b, and DI60c as shown in Table 37-10.

Figure 2-8 shows an example of a remote circuit using an independent power source which is powered while connected to a PIC32 non-5V tolerant circuit that is not powered.

**FIGURE 2-8: PIC32 NON-5V TOLERANT CIRCUIT EXAMPLE**

Without proper signal isolation, on non-5V tolerant pins, the remote signal can power the PIC32 device through the high side ESD protection diodes. Besides violating the absolute maximum rating specification, when VDD of the PIC32 device is restored and ramping up or ramping down, it can also negatively affect the internal Power-on Reset (POR) and Brown-out Reset (BOR) circuits, which can lead to improper initialization of internal PIC32 logic circuits. In these cases, it is recommended to implement digital or analog signal isolation as shown in Figure 2-9. This is indicative of all industry microcontrollers and not only Microchip products.

**FIGURE 2-9: EXAMPLE DIGITAL/ANALOG SIGNAL ISOLATION CIRCUITS**

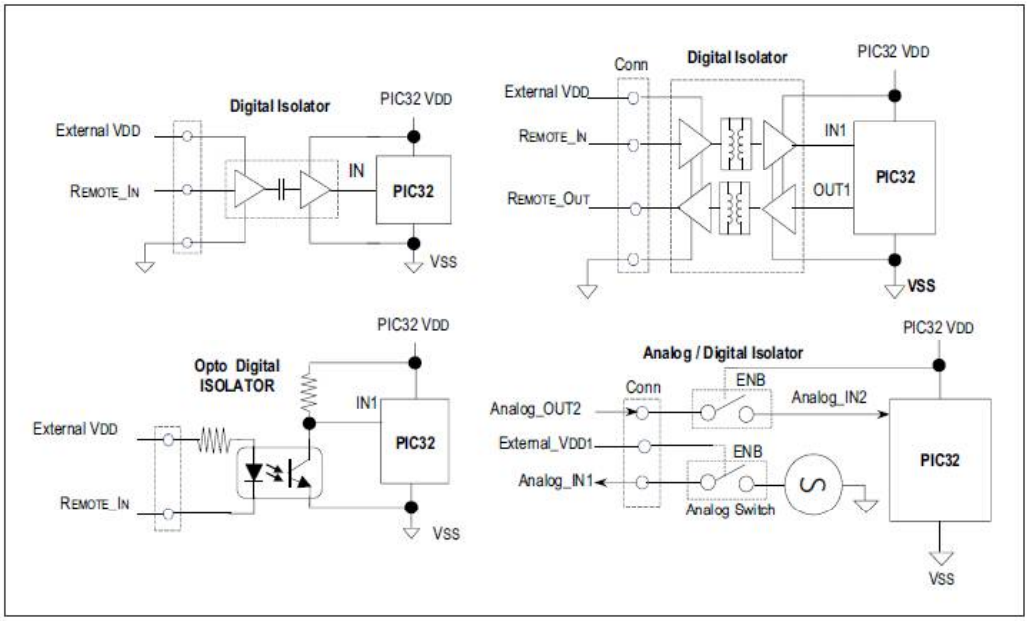

**TABLE 2-2: EXAMPLES OF DIGITAL ISOLATORS WITH OPTIONAL LEVEL TRANSLATION**

| Example Digital/Analog Signal Isolation Circuits | Inductive Coupling | Capacitive Coupling | Opto Coupling | Analog/Digital Coupling |
|---|---|---|---|---|
| ADuM7241/40 ARZ (1Mbps) | X | — | — | — |
| ADuM7241/40 ARZ (25 Mbps) | X | — | — | — |

| LTV-849S (4 Chan) | — | — | — | — |

### 2.11.2 5V TOLERANT INPUT PINS

The internal high-side diode on 5v tolerant pins are bussed to an internal floating node, rather than being connected to VDD, as shown in Figure 2-10. Voltages on these pins, if VDD < 2.3V, should not exceed roughly 3.2V relative to VSS of the PIC32 device.

Voltage of 3.6V or higher will violate the absolute maximum specification, and will stress the oxide layer separating the high side floating node, which impacts device reliability.

If a remotely powered "digital-only" signal can be guaranteed to always be ≤ 3.2V relative to Vss on the PIC32 device side, a 5V tolerant pin could be used without the need for a digital isolator. This is assuming there is not a ground loop issue, logic ground of the two circuits not at the same absolute level, and a remote logic low input is not less than VSS - 0.3V.

## 3.0 CPU

**Note 1:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

**2:** The Series 5 Warrior M-class CPU core resources are available at: www.imgtec.com.

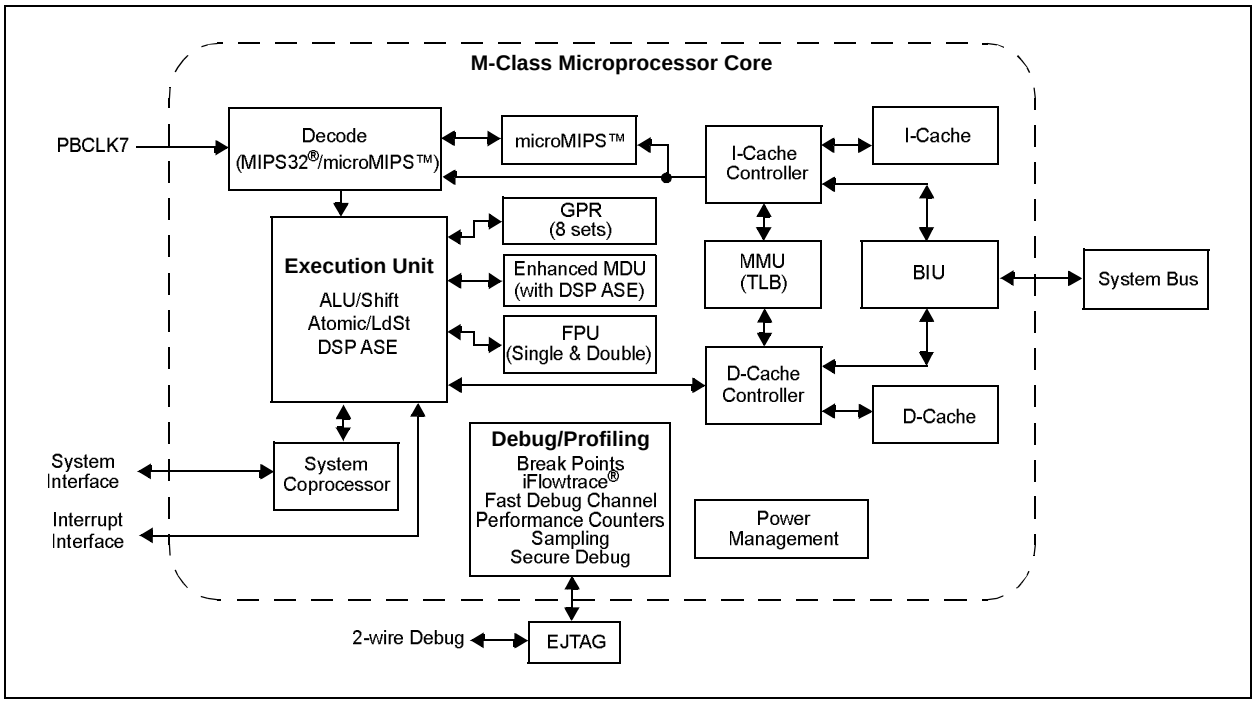

The MIPS32® M-Class Core is the heart of the PIC32MZ EF family device processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the proper destinations.

Key features include:

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32 Enhanced Architecture (Release 5):
  - Multiply-accumulate and multiply-subtract instructions
  - Targeted multiply instruction
  - Zero/One detect instructions
  - `WAIT` instruction
  - Conditional move instructions (`MOVN`, `MOVZ`)
  - Vectored interrupts
  - Programmable exception vector base
  - Atomic interrupt enable/disable
  - GPR shadow registers to minimize latency for interrupt handlers
  - Bit field manipulation instructions
  - Virtual memory support
- microMIPS™ compatible instruction set:
  - Improves code size density over MIPS32, while maintaining MIPS32 performance.
  - Supports all MIPS32 instructions (except branch-likely instructions)
  - Fifteen additional 32-bit instructions and 39 16-bit instructions corresponding to commonly-used MIPS32 instructions
  - Stack pointer implicit in instruction
  - MIPS32 assembly and ABI compatible
- MMU with Translation Lookaside Buffer (TLB) mechanism:
  - 16 dual-entry fully associative Joint TLB
  - 4-entry fully associative Instruction and Data TLB
  - 4 KB pages
- Separate L1 data and instruction caches:
  - 16 KB 4-way Instruction Cache (I-Cache)
  - 4 KB 4-way Data Cache (D-Cache)
- Autonomous Multiply/Divide Unit (MDU):
  - Maximum issue rate of one 32x32 multiply per clock
  - Early-in iterative divide. Minimum 12 and maximum 38 clock latency (dividend (*rs*) sign extension-dependent)
- Power Control:
  - Minimum frequency: 0 MHz
  - Low-Power mode (triggered by `WAIT` instruction)
  - Extensive use of local gated clocks
- EJTAG Debug and Instruction Trace:
  - Support for single stepping
  - Virtual instruction and data address/value breakpoints
  - Hardware breakpoint supports both address match and address range triggering.
  - Eight instruction and four data complex breakpoints
- iFlowtrace® version 2.0 support:
  - Real-time instruction program counter
  - Special events trace capability
  - Two performance counters with 34 user-selectable countable events
  - Disabled if the processor enters Debug mode
  - Program Counter sampling
- Four Watch registers:
  - Instruction, Data Read, Data Write options
  - Address match masking options
- DSP ASE Extension:
  - Native fractional format data type operations
  - Register Single Instruction Multiple Data (SIMD) operations (add, subtract, multiply, shift)
  - GPR-based shift
  - Bit manipulation
  - Compare-Pick
  - DSP Control Access
  - Indexed-Load
  - Branch
  - Multiplication of complex operands
  - Variable bit insertion and extraction
  - Virtual circular buffers
  - Arithmetic saturation and overflow handling
  - Zero-cycle overhead saturation and rounding operations
- Floating Point Unit (FPU):
  - 1985 IEEE-754 compliant Floating Point Unit
  - Supports single and double precision datatypes
  - 2008 IEEE-754 compatibility control of NaN handling and Abs/Neg instructions
  - Runs at 1:1 core/FPU clock ratio

A block diagram of the PIC32MZ EF family processor core is shown in Figure 3-1.

## 3.1 Architecture Overview

The MIPS32 M-Class Microprocessor core in PIC32MZ EF family devices contains several logic blocks working together in parallel, providing an efficient high-performance computing engine. The following blocks are included with the core:

- Execution unit
- General Purpose Register (GPR)
- Multiply/Divide Unit (MDU)
- System control coprocessor (CP0)
- Floating Point Unit (FPU)
- Memory Management Unit (MMU)
- Instruction/Data cache controllers
- Power Management
- Instructions and data caches
- microMIPS support
- Enhanced JTAG (EJTAG) controller

### 3.1.1 EXECUTION UNIT

The processor core execution unit implements a load/store architecture with single-cycle ALU operations (logical, shift, add, subtract) and an autonomous multiply/divide unit. The core contains thirty-two 32-bit General Purpose Registers (GPRs) used for integer operations and address calculation. Seven additional register file shadow sets (containing thirty-two registers) are added to minimize context switching overhead during interrupt/exception processing. The register file consists of two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

The execution unit includes:

- 32-bit adder used for calculating the data address
- Address unit for calculating the next instruction address
- Logic for branch determination and branch target address calculation
- Load aligner
- Trap condition comparator
- Bypass multiplexers used to avoid stalls when executing instruction streams where data producing instructions are followed closely by consumers of their results
- Leading Zero/One detect unit for implementing the `CLZ` and `CLO` instructions
- Arithmetic Logic Unit (ALU) for performing arithmetic and bitwise logical operations
- Shifter and store aligner
- DSP ALU and logic block for performing DSP instructions, such as arithmetic/shift/compare operations

### 3.1.2 MULTIPLY/DIVIDE UNIT (MDU)

The processor core includes a Multiply/Divide Unit (MDU) that contains a separate pipeline for multiply and divide operations, and DSP ASE multiply instructions. This pipeline operates in parallel with the Integer Unit (IU) pipeline and does not stall when the IU pipeline stalls. This allows MDU operations to be partially masked by system stalls and/or other integer unit instructions.

The high-performance MDU consists of a 32x32 booth recoded multiplier, four pairs of result/accumulation registers (HI and LO), a divide state machine, and the necessary multiplexers and control logic. The first number shown ('32' of 32x32) represents the *rs* operand. The second number ('32' of 32x32) represents the *rt* operand.

The MDU supports execution of one multiply or multiply-accumulate operation every clock cycle.

Divide operations are implemented with a simple 1-bit-per-clock iterative algorithm. An early-in detection checks the sign extension of the dividend (*rs*) operand. If *rs* is 8 bits wide, 23 iterations are skipped. For a 16-bit wide *rs*, 15 iterations are skipped and for a 24-bit wide *rs*, 7 iterations are skipped. Any attempt to issue a subsequent `MDU` instruction while a divide is still active causes an IU pipeline stall until the divide operation has completed.

Table 3-1 lists the repeat rate (peak issue rate of cycles until the operation can be reissued) and latency (number of cycles until a result is available) for the processor core multiply and divide instructions. The approximate latency and repeat rates are listed in terms of pipeline clocks.

**TABLE 3-1: MIPS32® M-CLASS MICROPROCESSOR CORE HIGH-PERFORMANCE INTEGER MULTIPLY/DIVIDE UNIT LATENCIES AND REPEAT RATES**

| Opcode | Operand Size (mul *rt*) (div *rs*) | Latency | Repeat Rate |
|---|---|---|---|
| `MULT/MULTU`, `MADD/MADDU`, `MSUB/MSUBU` (HI/LO destination) | 16 bits | 5 | 1 |
| | 32 bits | 5 | 1 |
| `MUL` (GPR destination) | 16 bits | 5 | 1 |
| | 32 bits | 5 | 1 |
| `DIV/DIVU` | 8 bits | 12/14 | 12/14 |
| | 16 bits | 20/22 | 20/22 |
| | 24 bits | 28/30 | 28/30 |
| | 32 bits | 36/38 | 36/38 |

The MIPS architecture defines that the result of a multiply or divide operation be placed in one of four pairs of HI and LO registers. Using the Move-From-HI (MFHI) and Move-From-LO (MFLO) instructions, these values can be transferred to the General Purpose Register file.

In addition to the HI/LO targeted operations, the MIPS32 architecture also defines a multiply instruction, MUL, which places the least significant results in the primary register file instead of the HI/LO register pair. By avoiding the explicit MFLO instruction required when using the LO register, and by supporting multiple destination registers, the throughput of multiply-intensive operations is increased.

Two other instructions, Multiply-Add (MADD) and Multiply-Subtract (MSUB), are used to perform the multiply-accumulate and multiply-subtract operations. The MADD instruction multiplies two numbers and then adds the product to the current contents of the HI and LO registers. Similarly, the MSUB instruction multiplies two operands and then subtracts the product from the HI and LO registers. The MADD and MSUB operations are commonly used in DSP algorithms.

The MDU also implements various shift instructions operating on the HI/LO register and multiply instructions as defined in the DSP ASE. The MDU supports all of the data types required for this purpose and includes three extra HI/LO registers as defined by the ASE.

Table 3-2 lists the latencies and repeat rates for the DSP multiply and dot-product operations. The approximate latencies and repeat rates are listed in terms of pipeline clocks.

**TABLE 3-2: DSP-RELATED LATENCIES AND REPEAT RATES**

| Op code | Latency | Repeat Rate |
|---|---|---|
| Multiply and dot-product without saturation after accumulation | 5 | 1 |
| Multiply and dot-product with saturation after accumulation | 5 | 1 |
| Multiply without accumulation | 5 | 1 |

### 3.1.3 SYSTEM CONTROL COPROCESSOR (CP0)

In the MIPS architecture, CP0 is responsible for the virtual-to-physical address translation and cache protocols, the exception control system, the processor's diagnostics capability, the operating modes (Kernel, User and Debug) and whether interrupts are enabled or disabled. Configuration information, such as cache size and set associativity, and the presence of options like microMIPS is also available by accessing the CP0 registers, as listed in Table 3-3. Refer to the "Series 5 Warrior M-class CPU core" resources which are available at: www.imgtec.com for more information.

### 3.1.4 FLOATING POINT UNIT (FPU)

The Floating Point Unit (FPU), Coprocessor (CP1), implements the MIPS Instruction Set Architecture for floating point computation. The implementation supports the ANSI/IEEE Standard 754 (IEEE for Binary Floating Point Arithmetic) for 32-bit and 64-bit floating point data formats. The FPU can be programmed to have thirty-two 32-bit or 64-bit floating point registers used for floating point operations.

The performance is optimized for 32-bit formats. Most instructions have one FPU cycle throughput and four FPU cycle latency. The FPU implements the multiply-add (MADD) and multiply-sub (MSUB) instructions with intermediate rounding after the multiply function. The result is guaranteed to be the same as executing a MUL and an ADD instruction separately, but the instruction latency, instruction fetch, dispatch bandwidth, and the total number of register accesses are improved.

IEEE denormalized input operands and results are supported by hardware for some instructions. IEEE denormalized results are not supported by hardware in general, but a fast flush-to-zero mode is provided to optimize performance. The fast flush-to-zero mode is enabled through the FCCR register, and use of this mode is recommended for best performance when denormalized results are generated.

The FPU has a separate pipeline for floating point instruction execution. This pipeline operates in parallel with the integer core pipeline and does not stall when the integer pipeline stalls. This allows long-running FPU operations, such as divide or square root, to be partially masked by system stalls and/or other integer unit instructions. Arithmetic instructions are always dispatched and completed in order, but loads and stores can complete out of order. The exception model is “precise” at all times.

Table 3-4 contains the floating point instruction latencies and repeat rates for the processor core. In this table, 'Latency' refers to the number of FPU cycles necessary for the first instruction to produce the result needed by the second instruction. The “Repeat Rate” refers to the maximum rate at which an instruction can be executed per FPU cycle.

**TABLE 3-4: FPU INSTRUCTION LATENCIES AND REPEAT RATES**

**Legend:** S = Single (32-bit) D = Double (64-bit) W = Word (32-bit) L = Long word (64-bit)

The FPU implements a high-performance 7-stage pipeline:

- Decode, register read and unpack (FR stage)
- Multiply tree, double pumped for double (M1 stage)
- Multiply complete (M2 stage)
- Addition first step (A1 stage)
- Addition second and final step (A2 stage)
- Packing to IEEE format (FP stage)
- Register writeback (FW stage)

The FPU implements a bypass mechanism that allows the result of an operation to be forwarded directly to the instruction that needs it without having to write the result to the FPU register and then read it back.

Table 3-5 lists the Coprocessor 1 Registers for the FPU.

## 3.2 Power Management

The processor core offers a number of power management features, including low-power design, active power management and power-down modes of operation. The core is a static design that supports slowing or halting the clocks, which reduces system power consumption during Idle periods.

### 3.2.1 INSTRUCTION-CONTROLLED POWER MANAGEMENT

The mechanism for invoking Power-Down mode is through execution of the `WAIT` instruction. For more information on power management, see **Section 33.0 "Power-Saving Features"**.

### 3.2.2 LOCAL CLOCK GATING

The majority of the power consumed by the processor core is in the clock tree and clocking registers. The PIC32MZ family makes extensive use of local gated-clocks to reduce this dynamic power consumption.

## 3.3 L1 Instruction and Data Caches

### 3.3.1 INSTRUCTION CACHE (I-CACHE)

The I-Cache is an on-core memory block of 16 Kbytes. Because the I-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access rather than having to wait for the physical address translation. The tag holds 22 bits of physical address, a valid bit, and a lock bit. The LRU replacement bits are stored in a separate array.

The I-Cache block also contains and manages the instruction line fill buffer. Besides accumulating data to be written to the cache, instruction fetches that reference data in the line fill buffer are serviced either by a bypass of that data, or data coming from the external interface. The I-Cache control logic controls the bypass function.

The processor core supports I-Cache locking. Cache locking allows critical code or data segments to be locked into the cache on a per-line basis, enabling the system programmer to maximize the efficiency of the system cache.

The cache locking function is always available on all I-Cache entries. Entries can then be marked as locked or unlocked on a per entry basis using the `CACHE` instruction.

### 3.3.2 DATA CACHE (D-CACHE)

The D-Cache is an on-core memory block of 4 Kbytes. This virtually indexed, physically tagged cache is protected. Because the D-Cache is virtually indexed, the virtual-to-physical address translation occurs in parallel with the cache access. The tag holds 22 bits of physical address, a valid bit, and a lock bit. There is an additional array holding dirty bits and LRU replacement algorithm bits for each set of the cache.

In addition to I-Cache locking, the processor core also supports a D-Cache locking mechanism identical to the I-Cache. Critical data segments are locked into the cache on a per-line basis. The locked contents can be updated on a store hit, but cannot be selected for replacement on a cache miss.

The D-Cache locking function is always available on all D-Cache entries. Entries can then be marked as locked or unlocked on a per-entry basis using the `CACHE` instruction.

### 3.3.3 ATTRIBUTES

The processor core I-Cache and D-Cache attributes are listed in the Configuration registers (see Register 3-1 through Register 3-4).

## 3.4 EJTAG Debug Support

The processor core provides for an Enhanced JTAG (EJTAG) interface for use in the software debug of application and kernel code. In addition to standard User mode and Kernel modes of operation, the processor core provides a Debug mode that is entered after a debug exception (derived from a hardware breakpoint, single-step exception, etc.) is taken and continues until a Debug Exception Return (`DERET`) instruction is executed. During this time, the processor executes the debug exception handler routine.

The EJTAG interface operates through the Test Access Port (TAP), a serial communication port used for transferring test data in and out of the core. In addition to the standard JTAG instructions, special instructions defined in the EJTAG specification specify which registers are selected and how they are used.

## 3.5 MIPS DSP ASE Extension

The MIPS DSP Application-Specific Extension Revision 2 is an extension to the MIPS32 architecture. This extension comprises new integer instructions and states that include new HI/LO accumulator register pairs and a DSP control register. This extension is crucial in a wide range of DSP, multimedia, and DSP-like algorithms covering Audio and Video processing applications. The extension supports native fractional format data type operations, register Single Instruction Multiple Data (SIMD) operations, such as add, subtract, multiply, and shift. In addition, the extension includes the following features that are essential in making DSP algorithms computationally efficient:

- Support for multiplication of complex operands
- Variable bit insertion and extraction
- Implementation and use of virtual circular buffers
- Arithmetic saturation and overflow handling support
- Zero cycle overhead saturation and rounding operations

## 3.6 microMIPS ISA

The processor core supports the microMIPS ISA, which contains all MIPS32 ISA instructions (except for branch-likely instructions) in a new 32-bit encoding scheme, with some of the commonly used instructions also available in 16-bit encoded format. This ISA improves code density through the additional 16-bit instructions while maintaining a performance similar to MIPS32 mode. In microMIPS mode, 16-bit or 32-bit instructions will be fetched and recoded to legacy MIPS32 instruction opcodes in the pipeline's I stage, so that the processor core can have the same microAptiv UP microarchitecture. Because the microMIPS instruction stream can be intermixed with 16-bit halfword or 32-bit word size instructions on halfword or word boundaries, additional logic is in place to address the word misalignment issues, thus minimizing performance loss.

## 3.7 M-Class Core Configuration

# 4.0 MEMORY ORGANIZATION

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source.For detailed information, refer to **Section 48. "Memory Organization and Permissions"** in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF microcontrollers provide 4 GB of unified virtual memory address space. All memory regions, including program, data memory, SFRs and Configuration registers, reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, PIC32MZ EF devices allow execution from data memory.

Key features include:

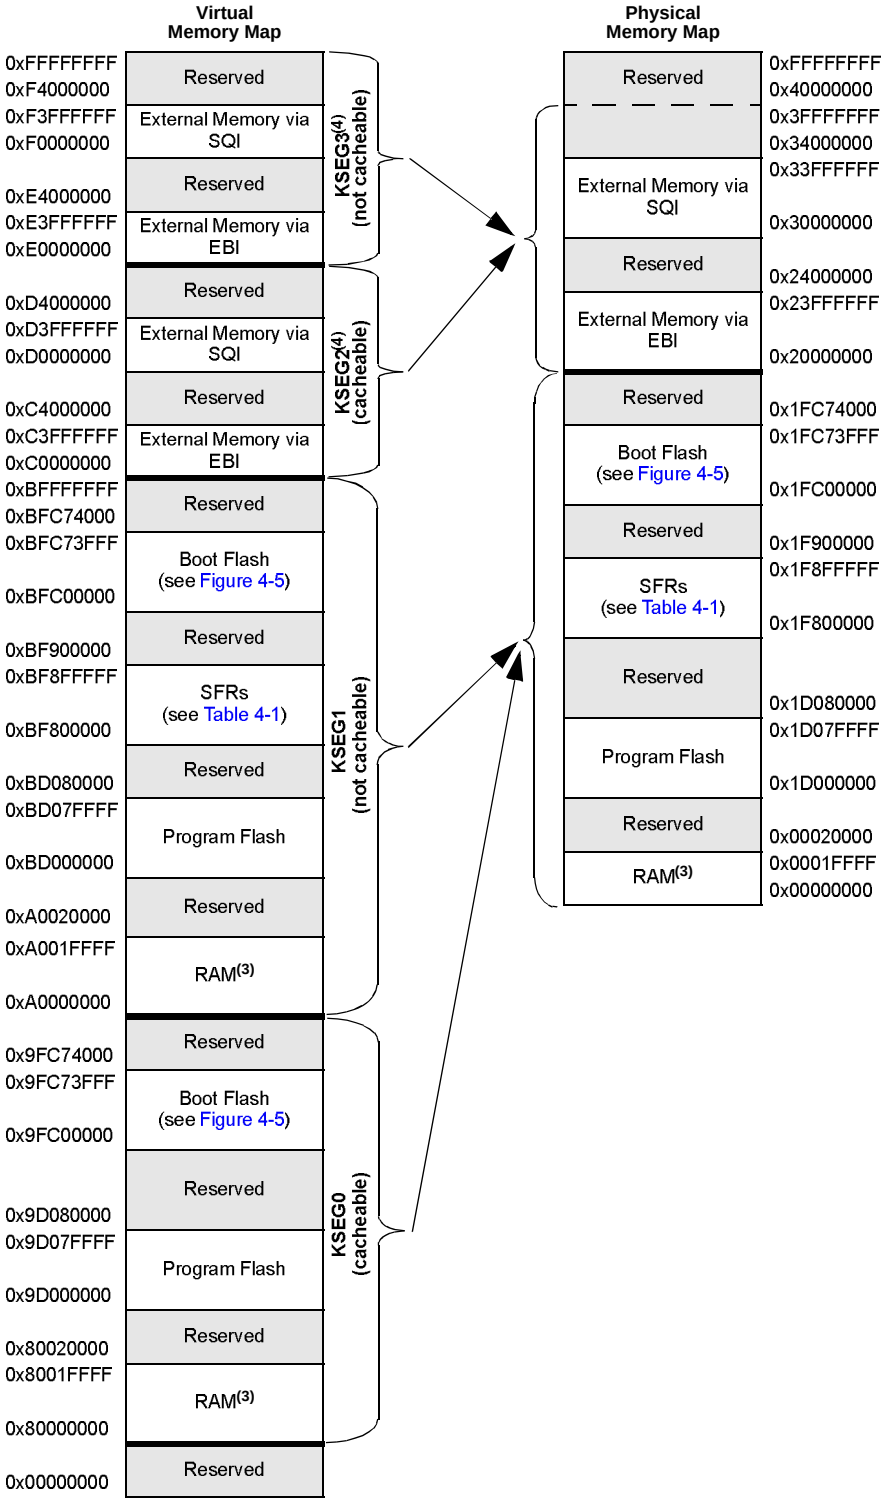

- 32-bit native data width
- Separate User (KUSEG) and Kernel (KSEG0/KSEG1/KSEG2/KSEG3) mode address space
- Separate boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Cacheable (KSEG0/KSEG2) and non-cacheable (KSEG1/KSEG3) address regions
- Read/write permission access to predefined memory regions

## 4.1 Memory Layout

PIC32MZ EF microcontrollers implement two address schemes: virtual and physical. All hardware resources, such as program memory, data memory and peripherals, are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by bus master peripherals, such as DMA and the Flash controller, that access memory independently of the CPU.

The main memory maps for the PIC32MZ EF devices are illustrated in Figure 4-1 through Figure 4-4. Figure 4-5 provides memory map information for boot Flash and boot alias. Table 4-1 provides memory map information for Special Function Registers (SFRs).

### 4.1.1 BOOT FLASH SEQUENCE AND CONFIGURATION SPACES

Sequence space is used to identify which boot Flash is aliased by aliased regions. If the value programmed into the TSEQ<15:0> bits of the BF1SEQ3 word is equal to or greater than the value programmed into the TSEQ<15:0> bits of the BF2SEQ3 word, boot Flash 1 is aliased by the lower boot alias region, and boot Flash 2 is aliased by the upper boot alias region. If the TSEQ<15:0> bits of the BF2SEQ3 word is greater than the TSEQ<15:0> bits of the BF1SEQ3 word, the opposite is true (see Table 4-2 and Table 4-3 for BFxSEQ3 word memory locations).

The CSEQ<15:0> bits must contain the one's complement value of the TSEQ<15:0> bits; otherwise, the value of the TSEQ<15:0> bits is considered invalid, and an alternate sequence is used. See **Section 4.1.2 "Alternate Sequence and Configuration Words"** for more information.

Once boot Flash memories are aliased, configuration space located in the lower boot alias region is used as the basis for the Configuration words, DEVSIGN0, DEVCP0, and DEVCFGx (and the associated alternate configuration registers). This means that the boot Flash region to be aliased by lower boot alias region memory must contain configuration values in the appropriate memory locations.

| | |
|---|---|
| **Note:** | Do not use word program operation (NVMOP<3:0> = 0001) when programming data into the sequence and configuration spaces. |

### 4.1.2 ALTERNATE SEQUENCE AND CONFIGURATION WORDS

Every word in the configuration space and sequence space has an associated alternate word (designated by the letter A as the first letter in the name of the word). During device start-up, primary words are read and if uncorrectable ECC errors are found, the BCFGERR (RCON<27>) flag is set and alternate words are used. If uncorrectable ECC errors are found in primary and alternate words, the BCFGFAIL (RCON<26>) flag is set and the default configuration is used.

## 4.2 System Bus Arbitration

As shown in the PIC32MZ EF Family Block Diagram (see Figure 1-1), there are multiple initiator modules (I1 through I14) in the system that can access various target modules (T1 through T13). Table 4-4 illustrates which initiator can access which target. The System Bus supports simultaneous access to targets by initiators, so long as the initiators are accessing different targets. The System Bus will perform arbitration, if multiple initiators attempt to access the same target.

The System Bus arbitration scheme implements a non-programmable, Least Recently Serviced (LRS) priority, which provides Quality Of Service (QOS) for most initiators. However, some initiators can use Fixed High Priority (HIGH) arbitration to guarantee their access to data.

The arbitration scheme for the available initiators is shown in Table 4-5.

**TABLE 4-5: INITIATOR ID AND QOS**

| Name | ID | QOS |
|---|---|---|
| CPU | 1 | LRS(1) |
| CPU | 2 | HIGH(1,2) |
| DMA Read | 3 | LRS(1) |
| DMA Read | 4 | HIGH(1,2) |
| DMA Write | 5 | LRS(1) |
| DMA Write | 6 | HIGH(1,2) |
| USB | 7 | LRS |
| Ethernet Read | 8 | LRS |
| Ethernet Write | 9 | LRS |
| CAN1 | 10 | LRS |
| CAN2 | 11 | LRS |
| SQI1 | 12 | LRS |
| Flash Controller | 13 | HIGH(2) |
| Crypto | 14 | LRS |

**Note 1:** When accessing SRAM, the DMAPRI bit (CFGCON<25>) and the CPUPRI bit (CFGCON<24>) provide arbitration control for the DMA and CPU (when servicing an interrupt (i.e., EXL = 1)), respectively, by selecting the use of LRS or HIGH When using HIGH, the DMA and CPU get arbitration preference over all initiators using LRS.

**2:** Using HIGH arbitration can have serious negative effects on other initiators. Therefore, it is recommended to not enable this type of arbitration for an initiator that uses significant system bandwidth. HIGH arbitration is intended to be used for low bandwidth applications that require low latency, such as LCC graphics applications.

## 4.3 Permission Access and System Bus Registers

The System Bus on PIC32MZ EF family of microcontrollers provides access control capabilities for the transaction initiators on the System Bus.

The System Bus divides the entire memory space into fourteen target regions and permits access to each target by initiators via permission groups. Four Permission Groups (0 through 3) can be assigned to each initiator. Each permission group is independent of the others and can have exclusive or shared access to a region.

Using the CFGPG register (see Register 34-10 in **Section 34.0 "Special Features"**), Boot firmware can assign a permission group to each initiator, which can make requests on the System Bus.

The available targets and their regions, as well as the associated control registers to assign protection, are described and listed in Table 4-6.

Register 4-2 through Register 4-10 are used for setting and controlling access permission groups and regions.

To change these registers, they must be unlocked in hardware. The register lock is controlled by the PGLOCK Configuration bit (CFGCON<11>). Setting PGLOCK prevents writes to the control registers; clearing PGLOCK allows writes.

To set or clear the PGLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

## 5.0 FLASH PROGRAM MEMORY

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices contain an internal Flash program memory for executing user code, which includes the following features:

- Two Flash banks for live update support
- Dual boot support
- Write protection for program and boot Flash
- ECC support

The user can program this memory using the following methods:

- Run-Time Self-Programming (RTSP)
- EJTAG Programming
- In-Circuit Serial Programming™ (ICSP™)

RTSP is performed by software, executing from either Flash or RAM memory. Information about RTSP techniques is available in **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) in the *"PIC32 Family Reference Manual"*.

EJTAG is performed using the EJTAG port of the device and an EJTAG capable programmer.

ICSP is performed using a serial data connection to the device and allows much faster programming times than RTSP.

The EJTAG and ICSP methods are described in the *"PIC32 Flash Programming Specification"* (DS60001145), which is available for download from the Microchip web site (www.microchip.com).

**Note:** In PIC32MZ EF devices, the Flash page size is 16 KB (4K IW) and the row size is 2 KB (512 IW).

| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **WR:** Write Control bit(1)
This bit cannot be cleared and can be set only when WREN = 1 and the unlock sequence has been performed.
1 = Initiate a Flash operation
0 = Flash operation is complete or inactive

bit 14 **WREN:** Write Enable bit(1)
1 = Enable writes to the WR bit and disables writes to the NVMOP<3:0> bits
0 = Disable writes to WR bit and enables writes to the NVMOP<3:0> bits

bit 13 **WRERR:** Write Error bit(1)
This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.
1 = Program or erase sequence did not complete successfully
0 = Program or erase sequence completed normally

bit 12 **LVDERR:** Low-Voltage Detect Error bit(1)
This bit can be cleared only by setting the NVMOP<3:0> bits = 0000 and initiating a Flash operation.
1 = Low-voltage detected (possible data corruption, if WRERR is set)
0 = Voltage level is acceptable for programming

bit 11-8 **Unimplemented:** Read as '0'

bit 7 **PFSWAP:** Program Flash Bank Swap Control bit
This bit is only writable when WREN = 0 and the unlock sequence has been performed.
1 = Program Flash Bank 2 is mapped to the lower mapped region and program Flash Bank 1 is mapped to the upper mapped region
0 = Program Flash Bank 1 is mapped to the lower mapped region and program Flash Bank 2 is mapped to the upper mapped region

**Note 1:** These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

**2:** This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

**REGISTER 5-1: NVMCON: FLASH PROGRAMMING CONTROL REGISTER (CONTINUED)**

bit 6 **BFSWAP:** Boot Flash Bank Alias Swap Control bit
This bit is only writable when WREN = 0 and the unlock sequence has been performed.
1 = Boot Flash Bank 2 is mapped to the lower boot alias and boot Flash Bank 1 is mapped to the upper boot alias
0 = Boot Flash Bank 1 is mapped to the lower boot alias and boot Flash Bank 2 is mapped to the upper boot alias

bit 5-4 **Unimplemented:** Read as '0'

bit 3-0 **NVMOP<3:0>:** NVM Operation bits
These bits are only writable when WREN = 0.
1111 = Reserved
•
•
•
1000 = Reserved
0111 = Program erase operation: erase all of program Flash memory (all pages must be unprotected, PWP<23:0> = 0x000000)
0110 = Upper program Flash memory erase operation: erases only the upper mapped region of program Flash (all pages in that region must be unprotected)
0101 = Lower program Flash memory erase operation: erases only the lower mapped region of program Flash (all pages in that region must be unprotected)
0100 = Page erase operation: erases page selected by NVMADDR, if it is not write-protected
0011 = Row program operation: programs row selected by NVMADDR, if it is not write-protected
0010 = Quad Word (128-bit) program operation: programs the 128-bit Flash word selected by NVMADDR, if it is not write-protected
0001 = Word program operation: programs word selected by NVMADDR, if it is not write-protected(2)
0000 = No operation

**Note 1:** These bits are only reset by a Power-on Reset (POR) and are not affected by other reset sources.

**2:** This operation results in a "no operation" (NOP) when the Dynamic Flash ECC Configuration bits = 00 (FECCCON<1:0> (DVCFG0<9:8>)), which enables ECC at all times. For all other FECCCON<1:0> bit settings, this command will execute, but will not write the ECC bits for the word and can cause DED errors if dynamic Flash ECC is enabled (FECCCON<1:0> = 01). Refer to **Section 52. "Flash Program Memory with Support for Live Update"** (DS60001193) for information regarding ECC and Flash programming.

## 6.0 RESETS

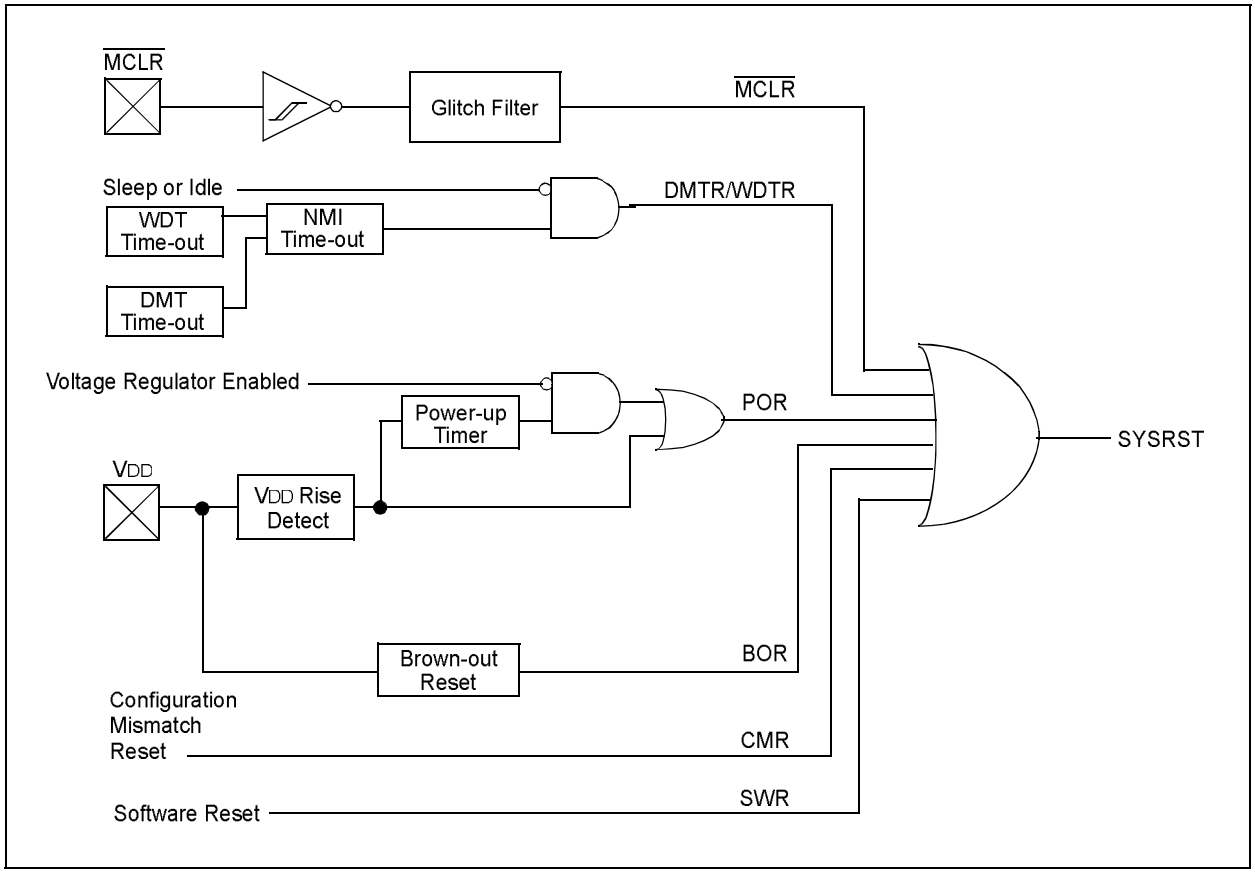

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. "Resets"** (DS60001118) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Reset module combines all Reset sources and controls the device Master Reset signal, SYSRST. The device Reset sources are as follows:

- Power-on Reset (POR)
- Master Clear Reset pin ($\overline{MCLR}$)
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Brown-out Reset (BOR)
- Configuration Mismatch Reset (CMR)
- Deadman Timer Reset (DMTR)

A simplified block diagram of the Reset module is illustrated in Figure 6-1.

|---|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 31-26 **Unimplemented:** Read as '0'

bit 25 **DMTO:** Deadman Timer Time-out Flag bit
1 = DMT time-out has occurred and caused a NMI
0 = DMT time-out has not occurred
Setting this bit will cause a DMT NMI event, and NMICNT will begin counting.

bit 24 **WDTO:** Watchdog Timer Time-Out Flag bit
1 = WDT time-out has occurred and caused a NMI
0 = WDT time-out has not occurred
Setting this bit will cause a WDT NMI event, and MNICNT will begin counting.

bit 23 **SWNMI:** Software NMI Trigger.
1 = An NMI will be generated
0 = An NMI will not be generated

bit 22-20 **Unimplemented:** Read as '0'

bit 19 **GNMI:** General NMI bit
1 = A general NMI event has been detected or a user-initiated NMI event has occurred
0 = A general NMI event has not been detected
Setting GNMI to a '1' causes a user-initiated NMI event. This bit is also set by writing 0x4E to the NMIKEY<7:0> (INTCON<31:24>) bits.

bit 18 **Unimplemented:** Read as '0'

bit 17 **CF:** Clock Fail Detect bit
1 = FSCM has detected clock failure and caused an NMI
0 = FSCM has not detected clock failure

Setting this bit will cause a a CF NMI event, but will not cause a clock switch to the BFRC.

bit 16 **WDTS:** Watchdog Timer Time-out in Sleep Mode Flag bit
1 = WDT time-out has occurred during Sleep mode and caused a wake-up from sleep
0 = WDT time-out has not occurred during Sleep mode

Setting this bit will cause a WDT NMI.

bit 15-0 **NMICNT<15:0>:** NMI Reset Counter Value bits
1111111111111111-0000000000000001 = Number of SYSCLK cycles before a device Reset occurs(1)
0000000000000000 = No delay between NMI assertion and device Reset event

**Note 1:** When a Watchdog Timer NMI event (when not in Sleep mode) or a Deadman Timer NMI event is triggered the NMICNT will start decrementing. When NMICNT reaches zero, the device is Reset. This NMI reset counter is only applicable to these two specific NMI events.

**Note:** The system unlock sequence must be performed before the SWRST bit can be written. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

## 7.0 CPU EXCEPTIONS AND INTERRUPT CONTROLLER

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. "Interrupt Controller"** (DS60001108) and **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices generate interrupt requests in response to interrupt events from peripheral modules. The Interrupt Controller module exists outside of the CPU and prioritizes the interrupt events before presenting them to the CPU.

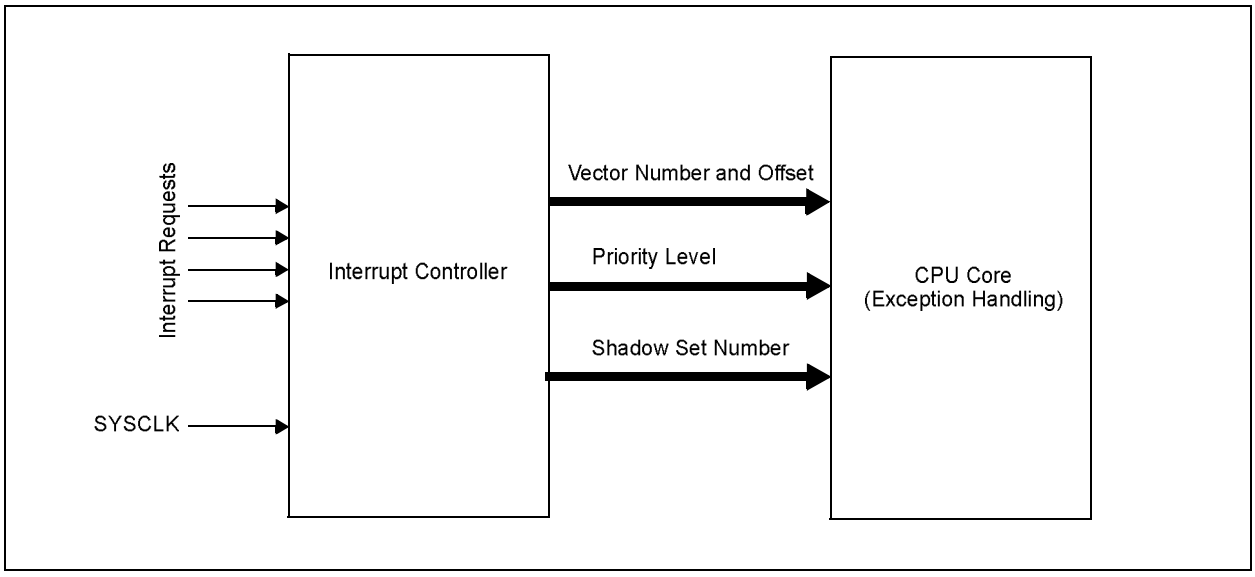

The CPU handles interrupt events as part of the exception handling mechanism, which is described in **Section 7.1 "CPU Exceptions"**.

The Interrupt Controller module includes the following features:

- Up to 213 interrupt sources and vectors with dedicated programmable offsets, eliminating the need for redirection
- Single and multi-vector mode operations
- Five external interrupts with edge polarity control
- Interrupt proximity timer
- Seven user-selectable priority levels for each vector
- Four user-selectable subpriority levels within each priority
- Seven shadow register sets that can be used for any priority level, eliminating software context switch and reducing interrupt latency
- Software can generate any interrupt

Figure 7-1 shows the block diagram for the Interrupt Controller and CPU exceptions.

**FIGURE 7-1: CPU EXCEPTIONS AND INTERRUPT CONTROLLER MODULE BLOCK DIAGRAM**

## 7.1 CPU Exceptions

CPU coprocessor 0 contains the logic for identifying and managing exceptions. Exceptions can be caused by a variety of sources, including boundary cases in data, external events or program errors. Table 7-1 lists the exception types in order of priority.

**TABLE 7-1: MIPS32® M-CLASS MICROPROCESSOR CORE EXCEPTION TYPES**

| Exception Type (In Order of Priority) | Description | Branches to | Status Bits Set | Debug Bits Set | EXCCODE | XC32 Function Name |
|---|---|---|---|---|---|---|
| Highest Priority | | | | | | |
| Reset | Assertion $\overline{\text{MCLR}}$ or a Power-on Reset (POR). | 0xBFC0_0000 | BEV, ERL | — | — | _on_reset |
| Soft Reset | Assertion of a software Reset. | 0xBFC0_0000 | BEV, SR, ERL | — | — | _on_reset |
| DSS | EJTAG debug single step. | 0xBFC0_0480 | — | DSS | — | — |
| DINT | EJTAG debug interrupt. Caused by the assertion of the external EJ_DINT input or by setting the EjtagBrk bit in the ECR register. | 0xBFC0_0480 | — | DINT | — | — |
| NMI | Assertion of NMI signal. | 0xBFC0_0000 | BEV, NMI, ERL | — | — | _nmi_handler |

## 7.2 Interrupts

The PIC32MZ EF family uses variable offsets for vector spacing. This allows the interrupt vector spacing to be configured according to application needs. A unique interrupt vector offset can be set for each vector using its associated OFFx register.

For details on the Variable Offset feature, refer to **8.5.2 "Variable Offset"** in **Section 8. "Interrupt Controller"** (DS60001108) of the *"PIC32 Family Reference Manual"*.

Table 7-2 provides the Interrupt IRQ, vector and bit location information.

## 8.0 OSCILLATOR CONFIGURATION

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

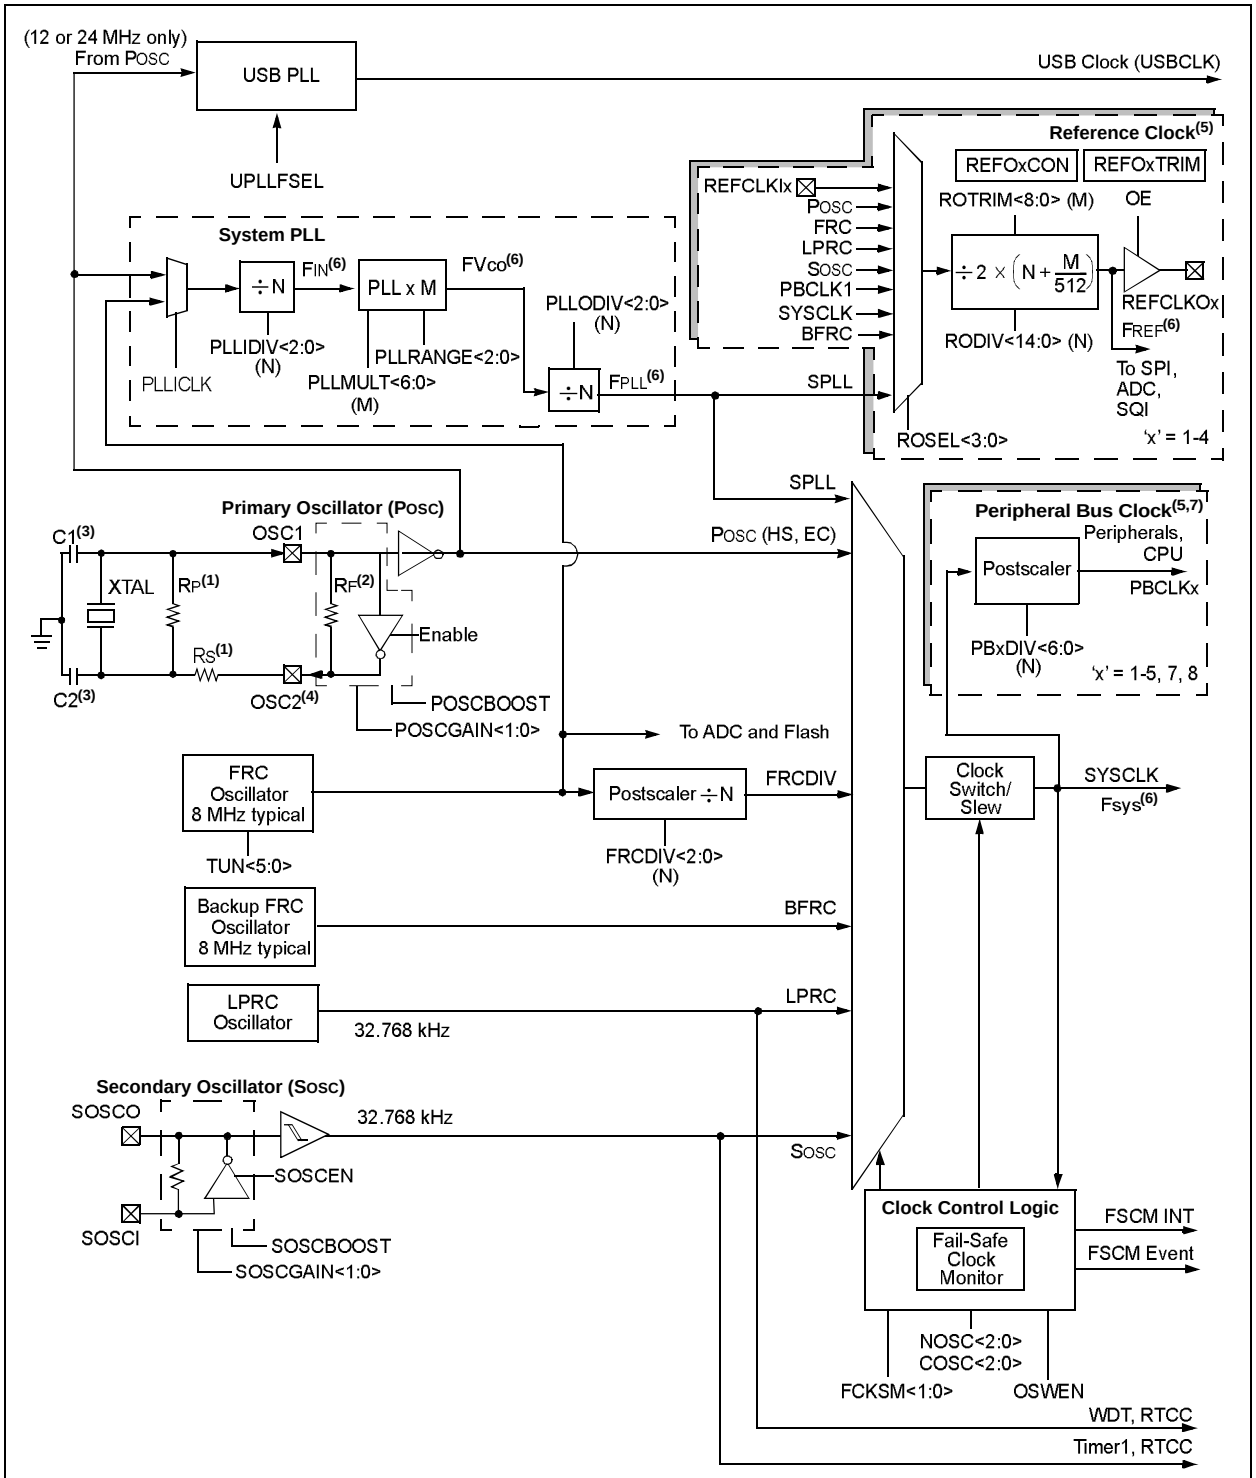

The PIC32MZ EF oscillator system has the following modules and features:

- A total of five external and internal oscillator options as clock sources
- On-Chip PLL with user-selectable input divider, multiplier and output divider to boost operating frequency on select internal and external oscillator sources
- On-Chip user-selectable divisor postscaler on select oscillator sources
- Software-controllable switching between various clock sources
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shutdown with dedicated Back-up FRC (BFRC)
- Dedicated On-Chip PLL for USB peripheral
- Flexible reference clock output
- Multiple clock branches for peripherals for better performance flexibility
- Clock switch/slew control with output divider

A block diagram of the oscillator system is shown in Figure 8-1. The clock distribution is provided in Table 8-1.

**Note:** Devices that support 252 MHz operation should be configured for SYSCLK <= 200 MHz operation. Adjust the dividers of the PBCLKs, and then increase the SYSCLK to the desired speed.

**FIGURE 8-1: PIC32MZ EF FAMILY OSCILLATOR DIAGRAM**

**Notes:**
1. A series resistor, RS, may be required for AT strip cut crystals, or to eliminate clipping. Alternately, to increase oscillator circuit gain, add a parallel resistor, RP.
2. The internal feedback resistor, RF, is typically in the range of 2 to 10 MΩ.
3. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the "*PIC32 Family Reference Manual*" for help in determining the best oscillator components.
4. PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.
5. Shaded regions indicate multiple instantiations of a peripheral or feature.
6. Refer to Table 37-19 in **Section 37.0 "Electrical Characteristics"** for frequency limitations.
7. If the DEVCFG registers are configured for a SYSCLK speed greater than 200 MHz, these PBCLKs will be running faster than the maximum rating when the device comes out of Reset. To ensure proper operation, firmware must start the device at a speed less than or equal to 200 MHz, adjust the speed of the PBCLKs, and then raise the SYSCLK speed to the desired speed.

**3:** Special Function Register (SFR) access only.

**4:** Timer1 only.

**5:** PBCLK1 divided by 2 is available on the OSC2 pin in certain clock modes.

## 8.1 Fail-Safe Clock Monitor (FSCM)

The PIC32MZ EF oscillator system includes a Fail-safe Clock Monitor (FSCM). The FSCM monitors the SYSCLK for continuous operation. If it detects that the SYSCLK has failed, it switches the SYSCLK over to the BFRC oscillator and triggers a NMI. The BFRC is an untuned 8 MHz oscillator that will drive the SYSCLK during FSCM event. When the NMI is executed, software can attempt to restart the main oscillator or shut down the system.

In Sleep mode both the SYSCLK and the FSCM halt, which prevents FSCM detection.

- 001 = System PLL (SPLL)
- 000 = Internal Fast RC (FRC) Oscillator divided by FRCDIV<2:0> bits (FRCDIV)

On Reset, these bits are set to the value of the FNOSC<2:0> Configuration bits (DEVCFG1<2:0>).

bit 7 **CLKLOCK:** Clock Selection Lock Enable bit
- 1 = Clock and PLL selections are locked
- 0 = Clock and PLL selections are not locked and may be modified

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **SLPEN:** Sleep Mode Enable bit
- 1 = Device will enter Sleep mode when a WAIT instruction is executed
- 0 = Device will enter Idle mode when a WAIT instruction is executed

bit 3 **CF:** Clock Fail Detect bit
- 1 = FSCM has detected a clock failure
- 0 = No clock failure has been detected

## 9.0 PREFETCH MODULE

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 41. "Prefetch Module for Devices with L1 CPU Cache"** (DS60001183) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Prefetch module is a performance enhancing module that is included in the PIC32MZ EF family of devices. When running at high-clock rates, Wait states must be inserted into Program Flash Memory (PFM) read transactions to meet the access time of the PFM. Wait states can be hidden to the core by prefetching and storing instructions in a temporary holding area that the CPU can access quickly. Although the data path to the CPU is 32 bits wide, the data path to the PFM is 128 bits wide. This wide data path provides the same bandwidth to the CPU as a 32-bit path running at four times the frequency.

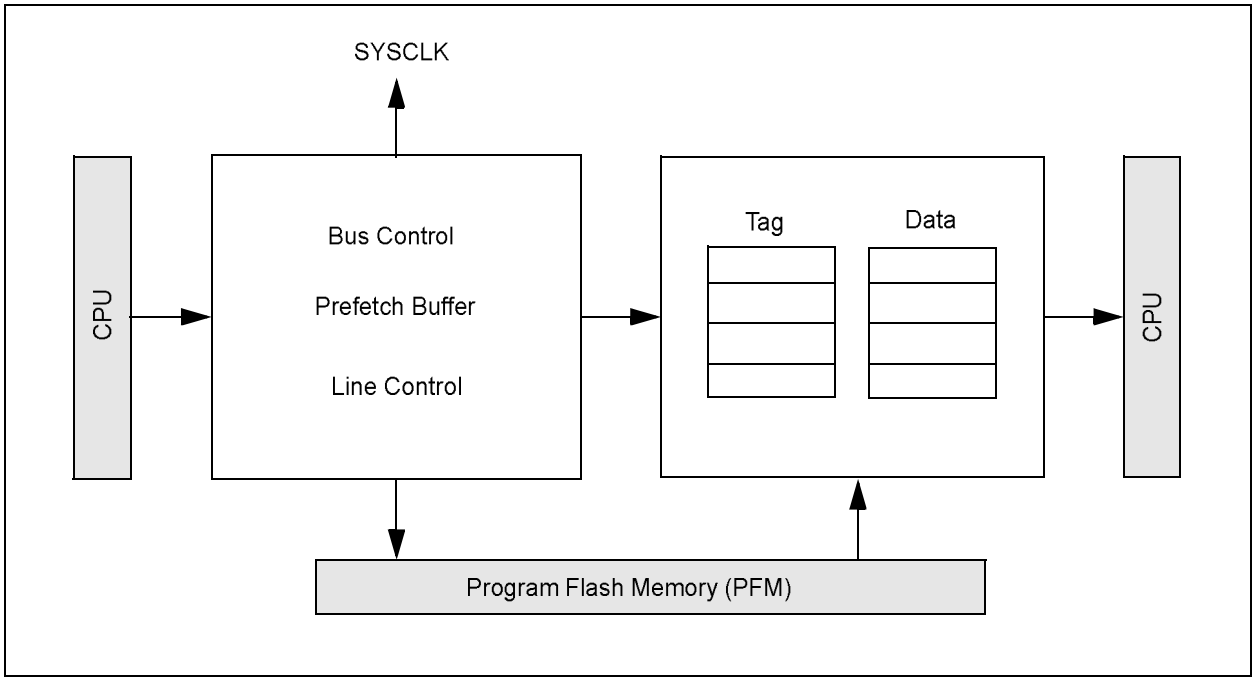

The Prefetch module holds a subset of PFM in temporary holding spaces known as lines. Each line contains a tag and data field. Normally, the lines hold a copy of what is currently in memory to make instructions or data available to the CPU without Flash Wait states.

The following are key features of the Prefetch module:

- 4x16 byte fully-associative lines
- One line for CPU instructions
- One line for CPU data
- Two lines for peripheral data
- 16-byte parallel memory fetch
- Configurable predictive prefetch
- Error detection and correction

A simplified block diagram of the Prefetch module is shown in Figure 9-1.

## 10.0 DIRECT MEMORY ACCESS (DMA) CONTROLLER

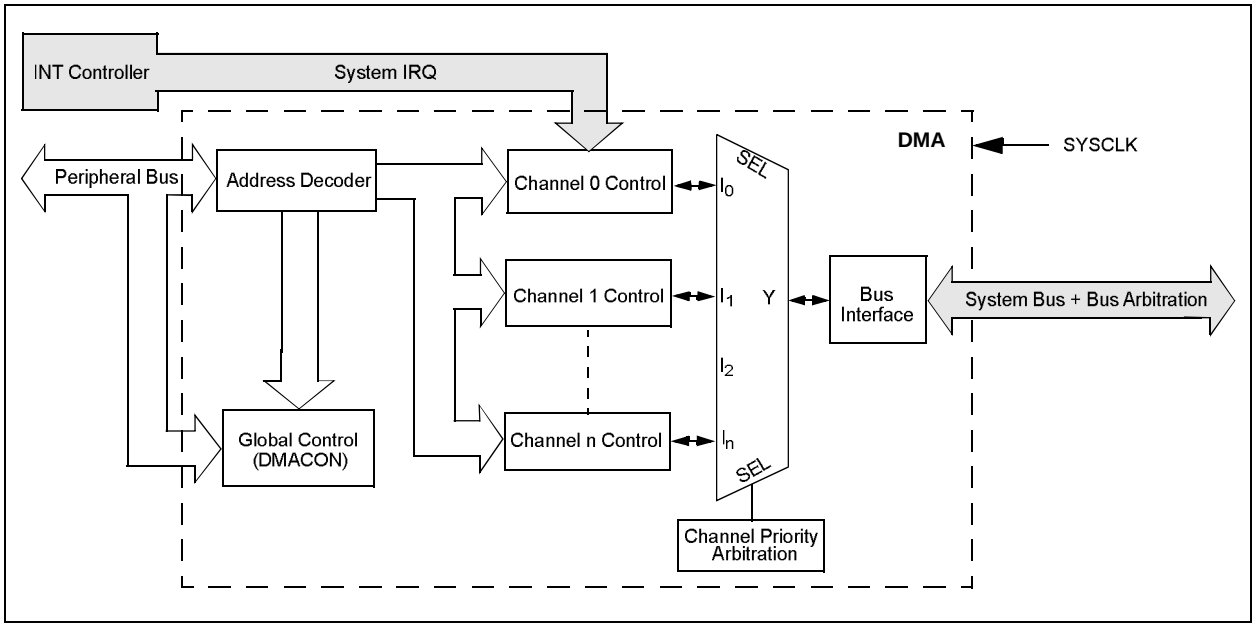

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 31. "Direct Memory Access (DMA) Controller"** (DS60001117) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Direct Memory Access (DMA) Controller is a bus master module useful for data transfers between different devices without CPU intervention. The source and destination of a DMA transfer can be any of the memory mapped modules existent in the device such as SPI, UART, PMP, etc., or memory itself.

The following are key features of the DMA Controller:

- Eight identical channels, each featuring:
  - Auto-increment source and destination address registers
  - Source and destination pointers
  - Memory to memory and memory to peripheral transfers
- Automatic word-size detection:
  - Transfer granularity, down to byte level
  - Bytes need not be word-aligned at source and destination
- Fixed priority channel arbitration
- Flexible DMA channel operating modes:
  - Manual (software) or automatic (interrupt) DMA requests
  - One-Shot or Auto-Repeat Block Transfer modes
  - Channel-to-channel chaining
- Flexible DMA requests:
  - A DMA request can be selected from any of the peripheral interrupt sources
  - Each channel can select any (appropriate) observable interrupt as its DMA request source
  - A DMA transfer abort can be selected from any of the peripheral interrupt sources
  - Up to 2-byte Pattern (data) match transfer termination
- Multiple DMA channel status interrupts:
  - DMA channel block transfer complete
  - Source empty or half empty
  - Destination full or half full
  - DMA transfer aborted due to an external event
  - Invalid DMA address generated
- DMA debug support features:
  - Most recent error address accessed by a DMA channel
  - Most recent DMA channel to transfer data
- CRC Generation module:
  - CRC module can be assigned to any of the available channels
  - CRC module is highly configurable

bit 27 **WBO:** CRC Write Byte Order Selection bit(1)
- 1 = Source data is written to the destination re-ordered as defined by BYTO<1:0>
- 0 = Source data is written to the destination unaltered

bit 26-25 **Unimplemented:** Read as '0'

bit 24 **BITO:** CRC Bit Order Selection bit

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):
- 1 = The IP header checksum is calculated Least Significant bit (LSb) first (i.e., reflected)
- 0 = The IP header checksum is calculated Most Significant bit (MSb) first (i.e., not reflected)

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):
- 1 = The LFSR CRC is calculated Least Significant bit first (i.e., reflected)
- 0 = The LFSR CRC is calculated Most Significant bit first (i.e., not reflected)

bit 23-13 **Unimplemented:** Read as '0'

bit 12-8 **PLEN<4:0>:** Polynomial Length bits(1)

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):

These bits are unused.

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):

Denotes the length of the polynomial – 1.

bit 7 **CRCEN:** CRC Enable bit
- 1 = CRC module is enabled and channel transfers are routed through the CRC module
- 0 = CRC module is disabled and channel transfers proceed normally

**Note 1:** When WBO = 1, unaligned transfers are not supported and the CRCAPP bit cannot be set.

**REGISTER 10-4: DCRCCON: DMA CRC CONTROL REGISTER (CONTINUED)**

bit 6 **CRCAPP:** CRC Append Mode bit(1)
- 1 = The DMA transfers data from the source into the CRC but NOT to the destination. When a block transfer completes the DMA writes the calculated CRC value to the location given by CHxDSA
- 0 = The DMA transfers data from the source through the CRC obeying WBO as it writes the data to the destination

bit 5 **CRCTYP:** CRC Type Selection bit
- 1 = The CRC module will calculate an IP header checksum
- 0 = The CRC module will calculate a LFSR CRC

bit 4-3 **Unimplemented:** Read as '0'

bit 2-0 **CRCCH<2:0>:** CRC Channel Select bits
- 111 = CRC is assigned to Channel 7
- 110 = CRC is assigned to Channel 6
- 101 = CRC is assigned to Channel 5
- 100 = CRC is assigned to Channel 4

bit 31-0 **DCRCDATA<31:0>:** CRC Data Register bits
Writing to this register will seed the CRC generator. Reading from this register will return the current value of the CRC. Bits greater than PLEN will return '0' on any read.

When CRCTYP (DCRCCON<5>) = 1 (CRC module is in IP Header mode):
Only the lower 16 bits contain IP header checksum information. The upper 16 bits are always '0'. Data written to this register is converted and read back in 1's complement form (i.e., current IP header checksum value).

When CRCTYP (DCRCCON<5>) = 0 (CRC module is in LFSR mode):
Bits greater than PLEN will return '0' on any read.

bit 31-24 **CHPIGN<7:0>:** Channel Register Data bits
Pattern Terminate mode:
Any byte matching these bits during a pattern match may be ignored during the pattern match determination when the CHPIGNEN bit is set. If a byte is read that is identical to this data byte, the pattern match logic will treat it as a "don't care" when the pattern matching logic is enabled and the CHPIGEN bit is set.

1 = Allow channel to be chained
0 = Do not allow channel to be chained

**Note 1:** The chain selection bit takes effect when chaining is enabled (i.e., CHCHN = 1).
**2:** When the channel is suspended by clearing this bit, the user application should poll the CHBUSY bit (if available on the device variant) to see when the channel is suspended, as it may take some clock cycles to complete a current transaction before the channel is suspended.

## 11.0 HI-SPEED USB WITH ON-THE-GO (OTG)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 51. "Hi-Speed USB with On-The-Go (OTG)"** (DS60001326) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Universal Serial Bus (USB) module contains analog and digital components to provide a USB 2.0 embedded host, device, or OTG implementation with a minimum of external components.

The module supports Hi-Speed, Full-Speed, or Low-Speed in any of the operating modes. This module in Host mode is intended for use as an embedded host and therefore does not implement a UHCI or OHCI controller.

The USB module consists of the RAM controller, packet encode/decode, UTM synchronization, end-point control, a dedicated USB DMA controller, pull-up and pull-down resistors, and the register interface. A block diagram of the PIC32 USB OTG module is presented in Figure 11-1.

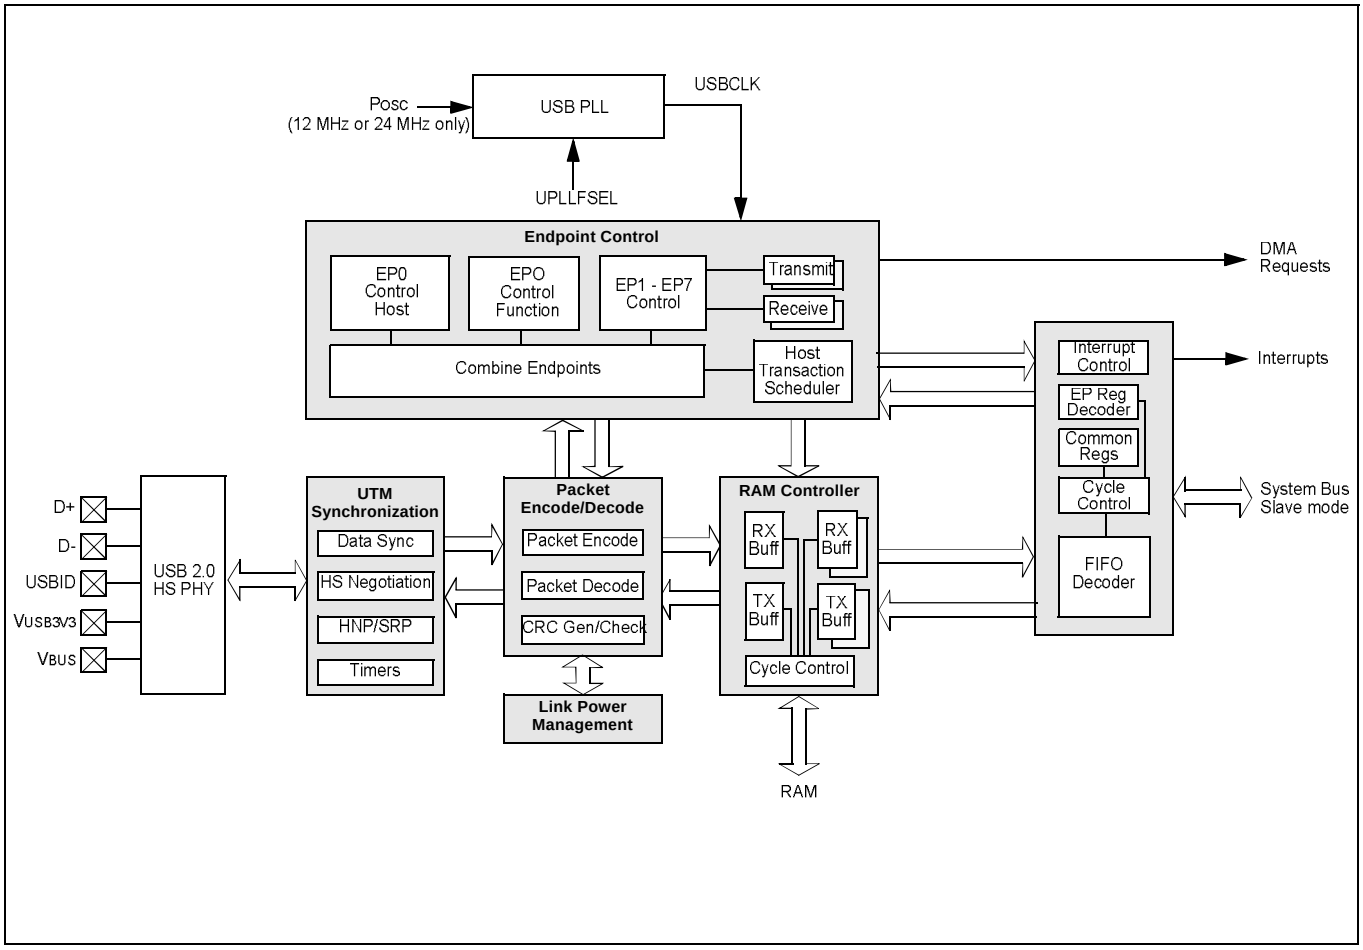

The USB module includes the following features:

- USB Hi-Speed, Full-Speed, and Low-Speed support for host and device
- USB OTG support with one or more Hi-Speed, Full-Speed, or Low-Speed device
- Integrated signaling resistors
- Integrated analog comparators for VBUS monitoring
- Integrated USB transceiver
- Transaction handshaking performed by hardware
- Integrated 8-channel DMA to access system RAM and Flash
- Seven transmit endpoints and seven receive endpoints, in addition to Endpoint 0
- Session Request Protocol (SRP) and Host Negotiation Protocol (HNP) support
- Suspend and resume signaling support
- Dynamic FIFO sizing
- Integrated RAM for the FIFOs, eliminating the need for system RAM for the FIFOs
- Link power management support

**Note 1:** The implementation and use of the USB specifications, as well as other third party specifications or technologies, may require licensing; including, but not limited to, USB Implementers Forum, Inc. (also referred to as USB-IF). The user is fully responsible for investigating and satisfying any applicable licensing obligations.

**2:** If the USB module is used, the Primary Oscillator (POSC) is limited to either 12 MHz or 24 MHz.

bit 31-24 **Unimplemented:** Read as '0'

bit 23-17 **EP7TXIF:EP1TXIF:** Endpoint 'n' TX Interrupt Flag bit
1 = Endpoint has a transmit interrupt to be serviced
0 = No interrupt event

bit 16 **EP0IF:** Endpoint 0 Interrupt bit
1 = Endpoint 0 has an interrupt to be serviced
0 = No interrupt event

All EPxTX and EP0 bits are cleared when the byte is read. Therefore, these bits must be read independently from the remaining bits in this register to avoid accidental clearing.

bit 15 **ISOUPD:** ISO Update bit (*Device mode only; unimplemented in Host mode*)
1 = USB module will wait for a SOF token from the time TXPKTRDY is set before sending the packet
0 = No change in behavior

This bit only affects endpoints performing isochronous transfers when in *Device mode*. This bit is unimplemented in *Host mode*.

bit 14 **SOFTCONN:** Soft Connect/Disconnect Feature Selection bit
1 = The USB D+/D- lines are enabled and active
0 = The USB D+/D- lines are disabled and are tri-stated

This bit is only available in *Device mode*.

bit 13 **HSEN:** Hi-Speed Enable bit
1 = The USB module will negotiate for Hi-Speed mode when the device is reset by the hub
0 = Module only operates in Full-Speed mode

bit 12 **HSMODE:** Hi-Speed Mode Status bit
1 = Hi-Speed mode successfully negotiated during USB reset
0 = Module is not in Hi-Speed mode

In *Device mode*, this bit becomes valid when a USB reset completes. In *Host mode*, it becomes valid when the RESET bit is cleared.

bit 11 **RESET:** Module Reset Status bit
1 = Reset signaling is present on the bus
0 = Normal module operation

In *Device mode*, this bit is read-only. In *Host mode*, this bit is read/write.

**REGISTER 11-1: USBCSR0: USB CONTROL STATUS REGISTER 0 (CONTINUED)**

bit 10 **RESUME:** Resume from Suspend control bit
1 = Generate Resume signaling when the device is in Suspend mode
0 = Stop Resume signaling

In *Device mode*, the software should clear this bit after 10 ms (a maximum of 15 ms) to end Resume signaling. In *Host mode*, the software should clear this bit after 20 ms.

bit 9 **SUSPMODE:** Suspend Mode status bit
1 = The USB module is in Suspend mode
0 = The USB module is in Normal operations

This bit is read-only in Device mode. In Host mode, it can be set by software, and is cleared by hardware.

bit 8 **SUSPEN:** Suspend Mode Enable bit
1 = Suspend mode is enabled
0 = Suspend mode is not enabled

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **FUNC<6:0>:** Device Function Address bits

These bits are only available in *Device mode*. This field is written with the address received through a SET_ADDRESS command, which will then be used for decoding the function address in subsequent token packets.

1 = Transfers the packet in the Endpoint 0 TX FIFO to the Endpoint 0 RX FIFO
0 = No transfer

bit 29 **FORCEFS:** Test mode Force Full-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Full-Speed mode. Undefined behavior if FORCEHS = 1.
0 = If FORCEHS = 0, places USB module into Low-Speed mode.

bit 28 **FORCEHS:** Test mode Force Hi-Speed Mode Select bit
This bit is only active if FORCEHST = 1.
1 = Forces USB module into Hi-Speed mode. Undefined behavior if FORCEFS = 1.
0 = If FORCEFS = 0, places USB module into Low-Speed mode.

bit 27 **PACKET:** Test_Packet Test Mode Select bit
This bit is only active if module is in Hi-Speed mode.
1 = The USB module repetitively transmits on the bus a 53-byte test packet. Test packet must be loaded into the Endpoint 0 FIFO before the test mode is entered.
0 = Normal operation

bit 26 **TESTK:** Test_K Test Mode Select bit
1 = Enters Test_K test mode. The USB module transmits a continuous K on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.

bit 25 **TESTJ:** Test_J Test Mode Select bit
1 = Enters Test_J test mode. The USB module transmits a continuous J on the bus.
0 = Normal operation
This bit is only active if the USB module is in Hi-Speed mode.

bit 24 **NAK:** Test_SE0_NAK Test Mode Select bit
1 = Enter Test_SE0_NAK test mode. The USB module remains in Hi-Speed mode but responds to any valid IN token with a NAK
0 = Normal operation

1 = USB Module will not issue PING tokens in data and status phases of a Hi-Speed Control transfer
0 = Ping tokens are issued

bit 26 **DTWREN:** Data Toggle Write Enable bit (*Host mode*)
1 = Enable the current state of the Endpoint 0 data toggle to be written. Automatically cleared.
0 = Disable data toggle write

bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
When read, this bit indicates the current state of the Endpoint 0 data toggle.
If DTWREN = 1, this bit is writable with the desired setting.
If DTWREN = 0, this bit is read-only.

bit 24 **FLSHFIFO:** Flush FIFO Control bit
1 = Flush the next packet to be transmitted/read from the Endpoint 0 FIFO. The FIFO pointer is reset and the TXPKTRDY/RXPKTRDY bit is cleared. Automatically cleared when the operation completes. Should only be used when TXPKTRDY/RXPKTRDY = 1.
0 = No Flush operation

bit 23 **SVCSETEND:** Clear SETUPEND Control bit (*Device mode*)
1 = Clear the SETUPEND bit in this register. This bit is automatically cleared.
0 = Do not clear

**NAKTMOUT:** NAK Time-out Control bit (*Host mode*)
1 = Endpoint 0 is halted following the receipt of NAK responses for longer than the time set by the NAKLIM<4:0> bits (USBICSR<28:24>)
0 = Allow the endpoint to continue

bit 22 **SVCRPR:** Serviced RXPKTRDY Clear Control bit (*Device mode*)
1 = Clear the RXPKTRDY bit in this register. This bit is automatically cleared.
0 = Do not clear

**STATPKT:** Status Stage Transaction Control bit (*Host mode*)
1 = When set at the same time as the TXPKTRDY or REQPKT bit is set, performs a status stage transaction
0 = Do not perform a status stage transaction

1 = Terminate the current transaction and transmit a STALL handshake. This bit is automatically cleared.
0 = Do not send STALL handshake.

**REQPKT:** IN transaction Request Control bit (*Host mode*)
1 = Request an IN transaction. This bit is cleared when the RXPKTRDY bit is set.
0 = Do not request an IN transaction

bit 20 **SETUPEND:** Early Control Transaction End Status bit (*Device mode*)
1 = A control transaction ended before the DATAEND bit has been set. An interrupt will be generated and the FIFO flushed at this time.
0 = Normal operation
This bit is cleared by writing a '1' to the SVCSETEND bit in this register.

**ERROR:** No Response Error Status bit (*Host mode*)
1 = Three attempts have been made to perform a transaction with no response from the peripheral. An interrupt is generated.
0 = Clear this flag. Software must write a '0' to this bit to clear it.

bit 19 **DATAEND:** End of Data Control bit (*Device mode*)
The software sets this bit when:
- Setting TXPKTRDY for the last data packet
- Clearing RXPKTRDY after unloading the last data packet
- Setting TXPKTRDY for a zero length data packet

Hardware clears this bit.

**SETUPPKT:** Send a SETUP token Control bit (*Host mode*)
1 = When set at the same time as the TXPKTRDY bit is set, the module sends a SETUP token instead of an OUT token for the transaction
0 = Normal OUT token operation

Setting this bit also clears the Data Toggle.

bit 18 **SENTSTALL:** STALL sent status bit (*Device mode*)
1 = STALL handshake has been transmitted
0 = Software clear of bit

**RXSTALL:** STALL handshake received Status bit (*Host mode*)
1 = STALL handshake was received
0 = Software clear of bit

bit 17 **TXPKTRDY:** TX Packet Ready Control bit
1 = Data packet has been loaded into the FIFO. It is cleared automatically.
0 = No data packet is ready for transmit

bit 16 **RXPKTRDY:** RX Packet Ready Status bit
1 = Data packet has been received. Interrupt is generated (when enabled) when this bit is set.
0 = No data packet has been received

This bit is cleared by setting the SVCRPR bit.

bit 31 **AUTOSET:** Auto Set Control bit

1 = TXPKTRDY will be automatically set when data of the maximum packet size (value in TXMAXP) is loaded into the TX FIFO. If a packet of less than the maximum packet size is loaded, then TXPKTRDY will have to be set manually.

0 = TXPKTRDY must be set manually for all packet sizes

bit 30 **ISO:** Isochronous TX Endpoint Enable bit (Device mode)

1 = Enables the endpoint for Isochronous transfers

0 = Disables the endpoint for Isochronous transfers and enables it for Bulk or Interrupt transfers.

This bit only has an effect in Device mode. In Host mode, it always returns zero.

bit 29 **MODE:** Endpoint Direction Control bit

1 = Endpoint is TX

0 = Endpoint is RX

This bit only has any effect where the same endpoint FIFO is used for both TX and RX transactions.

bit 28 **DMAREQEN:** Endpoint DMA Request Enable bit

1 = DMA requests are enabled for this endpoint

0 = DMA requests are disabled for this endpoint

bit 27 **FRCDATTG:** Force Endpoint Data Toggle Control bit

1 = Forces the endpoint data toggle to switch and the data packet to be cleared from the FIFO, regardless of whether an ACK was received.

0 = No forced behavior

bit 26 **DMAREQMD:** Endpoint DMA Request Mode Control bit

1 = DMA Request Mode 1

0 = DMA Request Mode 0

This bit must not be cleared either before or in the same cycle as the above DMAREQEN bit is cleared.

bit 25 **DATAWEN:** Data Toggle Write Enable bit (Host mode)

1 = Enable the current state of the TX Endpoint data toggle (DATATGGL) to be written

0 = Disables writing the DATATGGL bit

bit 24 **DATATGGL:** Data Toggle Control bit (Host mode)

When read, this bit indicates the current state of the TX Endpoint data toggle. If DATAWEN = 1, this bit may be written with the required setting of the data toggle. If DATAWEN = 0, any value written to this bit is ignored.

1 = For high-bandwidth Isochronous endpoint, a large packet has been split into 2 or 3 packets for transmission but insufficient IN tokens have been received to send all the parts

0 = Normal operation

In anything other than isochronous transfers, this bit will always return 0.

**NAKTMOUT:** NAK Time-out status bit (Host mode)

1 = TX endpoint is halted following the receipt of NAK responses for longer than the NAKLIM setting

0 = Written by software to clear this bit

bit 22 **CLRDT:** Clear Data Toggle Control bit

1 = Resets the endpoint data toggle to 0

0 = Do not clear the data toggle

bit 21 **SENTSTALL:** STALL handshake transmission status bit (Device mode)

1 = STALL handshake is transmitted. The FIFO is flushed and the TXPKTRDY bit is cleared.

0 = Written by software to clear this bit

**RXSTALL:** STALL receipt bit (Host mode)

1 = STALL handshake is received. Any DMA request in progress is stopped, the FIFO is completely flushed and the TXPKTRDY bit is cleared.

0 = Written by software to clear this bit

bit 20 **SENDSTALL:** STALL handshake transmission control bit (Device mode)

1 = Issue a STALL handshake to an IN token

0 = Terminate stall condition

This bit has no effect when the endpoint is being used for Isochronous transfers.

**SETUPPKT:** Definition bit (Host mode)

1 = When set at the same time as the TXPKTRDY bit is set, send a SETUP token instead of an OUT token for the transaction. This also clears the Data Toggle.

0 = Normal OUT token for the transaction

bit 19 **FLUSH:** FIFO Flush control bit

1 = Flush the latest packet from the endpoint TX FIFO. The FIFO pointer is reset, TXPKTRDY is cleared and an interrupt is generated.

0 = Do not flush the FIFO

bit 18 **UNDERRUN:** Underrun status bit (Device mode)

1 = An IN token has been received when TXPKTRDY is not set.

0 = Written by software to clear this bit.

**ERROR:** Handshake failure status bit (Host mode)

1 = Three attempts have been made to send a packet and no handshake packet has been received

0 = Written by software to clear this bit.

bit 17 **FIFONE:** FIFO Not Empty status bit

1 = There is at least 1 packet in the TX FIFO

0 = TX FIFO is empty

bit 16 **TXPKTRDY:** TX Packet Ready Control bit

The software sets this bit after loading a data packet into the FIFO. It is cleared automatically when a data packet has been transmitted. This bit is also automatically cleared prior to loading a second packet into a double-buffered FIFO.

bit 15-11 **MULT<4:0>:** Multiplier Control bits

For Isochronous/Interrupt endpoints or of packet splitting on Bulk endpoints, multiplies TXMAXP by MULT+1 for the payload size.

For Bulk endpoints, MULT can be up to 32 and defines the number of “USB” packets of the specified payload into which a single data packet placed in the FIFO should be split, prior to transfer. The data packet is required to be an exact multiple of the payload specified by TXMAXP.

For Isochronous/Interrupts endpoints operating in Hi-Speed mode, MULT may be either 2 or 3 and specifies the maximum number of such transactions that can take place in a single microframe.

bit 10-0 **TXMAXP<10:0>:** Maximum TX Payload per transaction Control bits

This field sets the maximum payload (in bytes) transmitted in a single transaction. The value is subject to the constraints placed by the USB Specification on packet sizes for Bulk, Interrupt and Isochronous transfers in Full-Speed and Hi-Speed operations.

TXMAXP must be set to an even number of bytes for proper interrupt generation in DMA Mode 1.

0 = Enable the RX endpoint for Bulk/Interrupt transfers

**AUTORQ:** Automatic Packet Request Control bit (*Host mode*)

1 = REQPKT will be automatically set when RXPKTRDY bit is cleared.

0 = No automatic packet request

This bit is automatically cleared when a short packet is received.

bit 29 **DMAREQEN:** DMA Request Enable Control bit

1 = Enable DMA requests for the RX endpoint.

0 = Disable DMA requests for the RX endpoint.

bit 28 **DISNYET:** Disable NYET Handshakes Control/PID Error Status bit (*Device mode*)

1 = In Bulk/Interrupt transactions, disables the sending of NYET handshakes. All successfully received RX packets are ACKed including at the point at which the FIFO becomes full.

0 = Normal operation.

In Bulk/Interrupt transactions, this bit only has any effect in Hi-Speed mode, in which mode it should be set for all Interrupt endpoints.

bit 31-0 **DATA<31:0>:** USB Transmit/Receive FIFO Data bits

Writes to this register loads data into the TxFIFO for the corresponding endpoint. Reading from this register unloads data from the RxFIFO for the corresponding endpoint.

Transfers may be 8-bit, 16-bit or 32-bit as required, and any combination of access is allowed provided the data accessed is contiguous. However, all transfers associated with one packet must be of the same width so that data is consistently byte-, word- or double-word aligned. The last transfer may contain fewer bytes than the previous transfers in order to complete an odd-byte or odd-word transfer.

bit 31-0 **DMACOUNT<31:0>:** DMA Transfer Count bits

This register identifies the current DMA count of the transfer. Software will set the initial count of the transfer which identifies the entire transfer length. As the count progresses this count is decremented as bytes are transferred.

1 = Initiate resume (remote wake-up). Resume signaling is asserted for 50 µs.
0 = No resume operation
This bit is self-clearing.

**REGISTER 11-28: USBLPMR1: USB LINK POWER MANAGEMENT CONTROL REGISTER 1 (CONTINUED)**

bit 16 **LPMXMT:** LPM Transition to the L1 State bit

When in *Device mode*:

1 = USB module will transition to the L1 state upon the receipt of the next LPM transaction. LPMEN must be set to '0b11. Both LPMXMT and LPMEN must be set in the same cycle.

0 = Maintain current state

When LPMXMT and LPMEN are set, the USB module can respond in the following ways:

- If no data is pending (all TX FIFOs are empty), the USB module will respond with an ACK. The bit will self clear and a software interrupt will be generated.
- If data is pending (data resides in at least one TX FIFO), the USB module will respond with a NYET. In this case, the bit will not self clear however a software interrupt will be generated.

When in *Host mode*:

1 = USB module will transmit an LPM transaction. This bit is self clearing, and will be immediately cleared upon receipt of any Token or three time-outs have occurred.

0 = Maintain current state

bit 15-12 **ENDPOINT<3:0>:** LPM Token Packet Endpoint bits

This is the endpoint in the token packet of the LPM transaction.

bit 11-9 **Unimplemented:** Read as '0'

bit 8 **RMTWAK:** Remote Wake-up Enable bit

This bit is applied on a temporary basis only and is only applied to the current suspend state.

1 = Remote wake-up is enabled

0 = Remote wake-up is disabled

bit 7-4 **HIRD<3:0>:** Host Initiated Resume Duration bits

The minimum time the host will drive resume on the bus. The value in this register corresponds to an actual resume time of:

Resume Time = 50 µs + HIRD * 75 µs. The resulting range is 50 µs to 1200 µs.

bit 3-0 **LNKSTATE<3:0>:** Link State bits

This value is provided by the host to the peripheral to indicate what state the peripheral must transition to after the receipt and acceptance of a LPM transaction. The only valid value for this register is '1' for Sleep State (L1). All other values are reserved.

## 12.0 I/O PORTS

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "I/O Ports"** (DS60001120) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

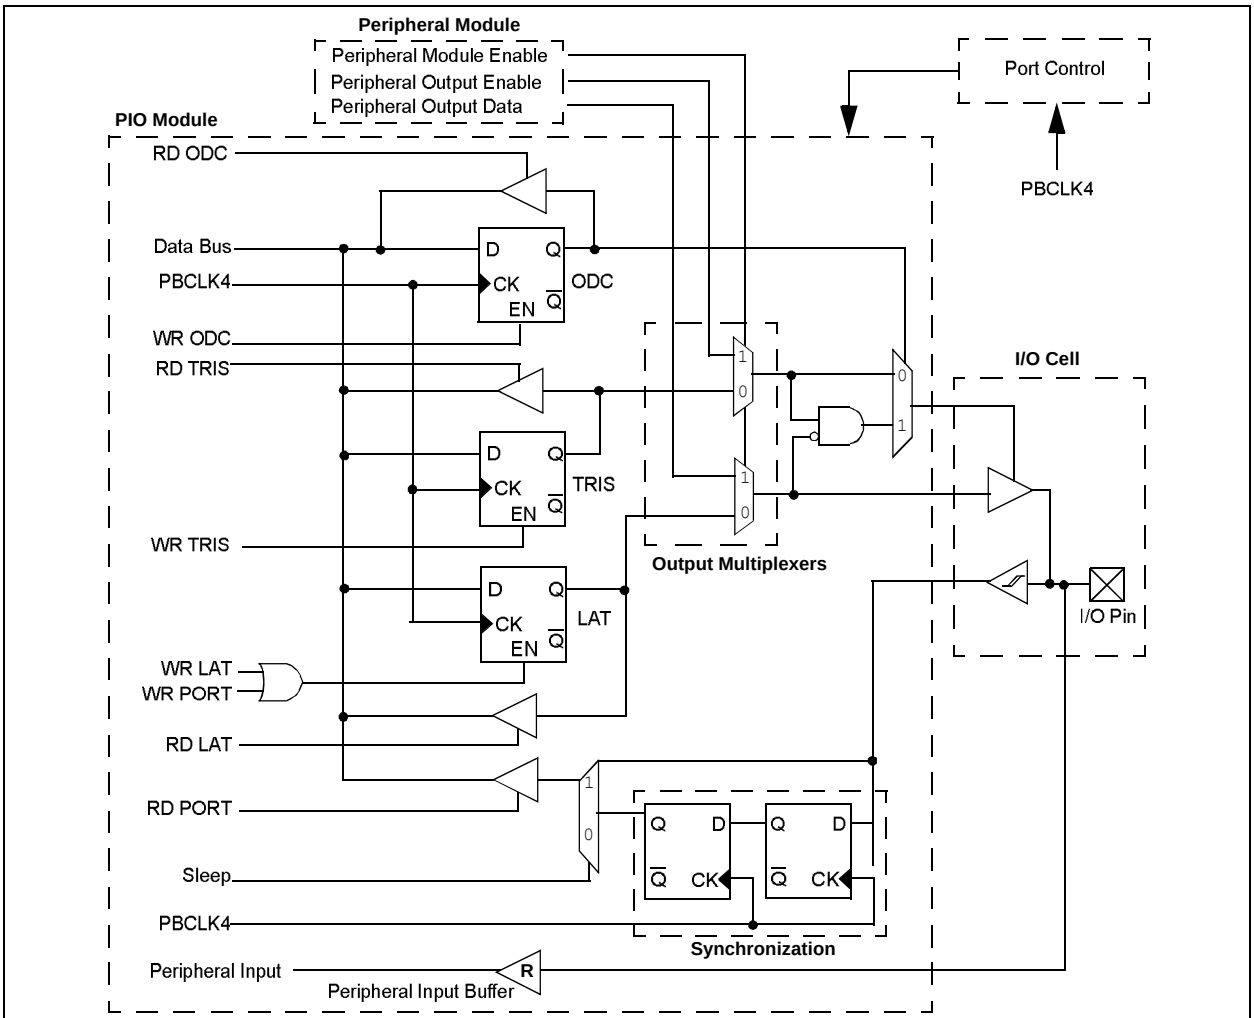

General purpose I/O pins are the simplest of peripherals. They allow the PIC32MZ EF family device to monitor and control other devices. To add flexibility and functionality, some pins are multiplexed with alternate function(s). These functions depend on which peripheral features are on the device. In general, when a peripheral is functioning, that pin may not be used as a general purpose I/O pin.

Some of the key features of the I/O ports are:

- Individual output pin open-drain enable/disable
- Individual input pin weak pull-up and pull-down
- Monitor selective inputs and generate interrupt when change in pin state is detected
- Operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET and INV registers

Figure 12-1 illustrates a block diagram of a typical multiplexed I/O port.

**FIGURE 12-1: BLOCK DIAGRAM OF A TYPICAL MULTIPLEXED PORT STRUCTURE**

**Legend:** R = Peripheral input buffer types may vary. Refer to Table 1-1 for peripheral details.

**Note:** This block diagram is a general representation of a shared port/peripheral structure for illustration purposes only. The actual structure for any specific port/peripheral combination may be different than it is shown here.

## 12.1 Parallel I/O (PIO) Ports

All port pins have up to 14 registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

### 12.1.1 OPEN-DRAIN CONFIGURATION

In addition to the PORTx, LATx, and TRISx registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V-tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

Refer to the pin name tables (Table 2 through Table 5) for the available pins and their functionality.

### 12.1.2 CONFIGURING ANALOG AND DIGITAL PORT PINS

The ANSELx register controls the operation of the analog port pins. The port pins that are to function as analog inputs must have their corresponding ANSEL and TRIS bits set. In order to use port pins for I/O functionality with digital modules, such as Timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx register has a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

If the TRIS bit is cleared (output) while the ANSELx bit is set, the digital output level (VOH or VOL) is converted by an analog peripheral, such as the ADC module or Comparator module.

When the PORT register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

### 12.1.3 I/O PORT WRITE/READ TIMING

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be an NOP.

### 12.1.4 INPUT CHANGE NOTIFICATION

The input change notification function of the I/O ports allows the PIC32MZ EF devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a change-of-state.

Seven control registers are associated with the CN functionality of each I/O port. The CNENx/CNNEx registers contain the CN interrupt enable control bits for each of the input pins. Setting any of these bits enables a CN interrupt for the corresponding pins. CNENx enables a mismatch CN interrupt condition when the EDGEDETECT bit (CNCONx<11>) is not set. When the EDGEDETECT bit is set, CNNEx controls the negative edge while CNENx controls the positive.

The CNSTATx/CNFx registers indicate the status of change notice based on the setting of the EDGEDETECT bit. If the EDGEDETECT bit is set to '0', the CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit. If the EDGEDETECT bit is set to '1', the CNFx register indicates whether a change has occurred and through the CNNEx/CNENx registers the edge type of the change that occurred is also indicated.

Each I/O pin also has a weak pull-up and a weak pull-down connected to it. The pull-ups act as a current source or sink source connected to the pin, and eliminate the need for external resistors when push-button or keypad devices are connected. The pull-ups and pull-downs are enabled separately using the CNPUx and the CNPDx registers, which contain the control bits for each of the pins. Setting any of the control bits enables the weak pull-ups and/or pull-downs for the corresponding pins.

| **Note:** | Pull-ups and pull-downs on change notification pins should always be disabled when the port pin is configured as a digital output. |

## 12.2 Registers for Slew Rate Control

Some I/O pins can be configured for various types of slew rate control on its associated port. This is controlled by the Slew Rate Control bits in the SRCON1x and SRCON0x registers that are associated with each I/O port. The slew rate control is configured using the corresponding bit in each register, as shown in Table 12-1.

As an example, writing 0x0001, 0x0000 to SRCON1A and SRCON0A, respectively, will enable slew rate control on the RA0 pin and sets the slew rate to the slow edge rate.

**TABLE 12-1: SLEW RATE CONTROL BIT SETTINGS**

| SRCON1x | SRCON0x | Description |
|---|---|---|
| 1 | 1 | Slew rate control is enabled and is set to the slowest edge rate. |
| 1 | 0 | Slew rate control is enabled and is set to the slow edge rate. |
| 0 | 1 | Slew rate control is enabled and is set to the medium edge rate. |
| 0 | 0 | Slew rate control is disabled and is set to the fastest edge rate. |

**Note:** By default, all of the Port pins are set to the fastest edge rate.

## 12.3 CLR, SET, and INV Registers

Every I/O module register has a corresponding CLR (clear), SET (set) and INV (invert) register designed to provide fast atomic bit manipulations. As the name of the register implies, a value written to a SET, CLR or INV register effectively performs the implied operation, but only on the corresponding base register and only bits specified as '1' are modified. Bits specified as '0' are not modified.

Reading SET, CLR and INV registers returns undefined values. To see the affects of a write operation to a SET, CLR or INV register, the base register must be read.

## 12.4 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin-count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

PPS configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The PPS configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

### 12.4.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the PPS feature include the designation "RPn" in their full pin designation, where "RP" designates a remappable peripheral and "n" is the remappable port number.

### 12.4.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital-only peripherals. These include general serial communications (UART, SPI, and CAN), general purpose timer clock inputs, timer-related peripherals (input capture and output compare), interrupt-on-change inputs, and reference clocks (input and output).

In comparison, some digital-only peripheral modules are never included in the PPS feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include $I^2C$ among others. A similar requirement excludes all modules with analog inputs, such as the Analog-to-Digital Converter (ADC).

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

### 12.4.3 CONTROLLING PPS

PPS features are controlled through two sets of SFRs: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

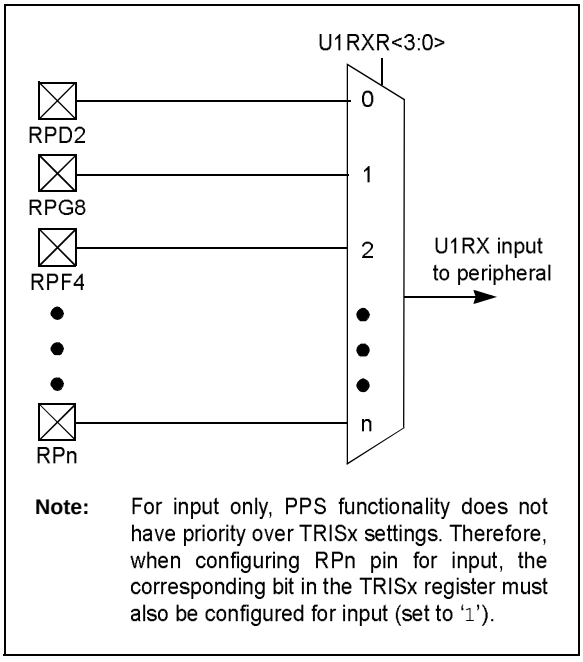

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

### 12.4.4 INPUT MAPPING

The inputs of the PPS options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The [*pin name*]R registers, where [*pin name*] refers to the peripheral pins listed in Table 12-2, are used to configure peripheral input mapping (see Register 12-1). Each register contains sets of 4 bit fields. Programming these bit fields with an appropriate value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field is shown in Table 12-2.

For example, Figure 12-2 illustrates the remappable pin selection for the U1RX input.

**FIGURE 12-2: REMAPPABLE INPUT EXAMPLE FOR U1RX**

**Note:** For input only, PPS functionality does not have priority over TRISx settings. Therefore, when configuring RPn pin for input, the corresponding bit in the TRISx register must also be configured for input (set to '1').

### 12.4.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPnR registers (Register 12-2) are used to control output mapping. Like the [*pin name*]R registers, each register contains sets of 4 bit fields. The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 12-3 and Figure 12-3).

A null output is associated with the output register reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

**FIGURE 12-3: EXAMPLE OF MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPF0**

### 12.4.6 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. PIC32MZ EF devices include two features to prevent alterations to the peripheral map:

- Control register lock sequence
- Configuration bit select lock

#### 12.4.6.1 Control Register Lock

Under normal operation, writes to the RPnR and [*pin name*]R registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK Configuration bit (CFGCON<13>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear the IOLOCK bit, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** in the *"PIC32 Family Reference Manual"* for details.

#### 12.4.6.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPnR and [*pin name*]R registers. The IOL1WAY Configuration bit (DEVCFG3<29>) blocks the IOLOCK bit from being cleared after it has been set once. If IOLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session.

## 13.0 TIMER1

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. "Timers"** (DS60001105) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices feature one synchronous/asynchronous 16-bit timer that can operate as a free-running interval timer for various timing applications and counting external events. This timer can also be used with the Low-Power Secondary Oscillator (SOSC) for real-time clock applications.

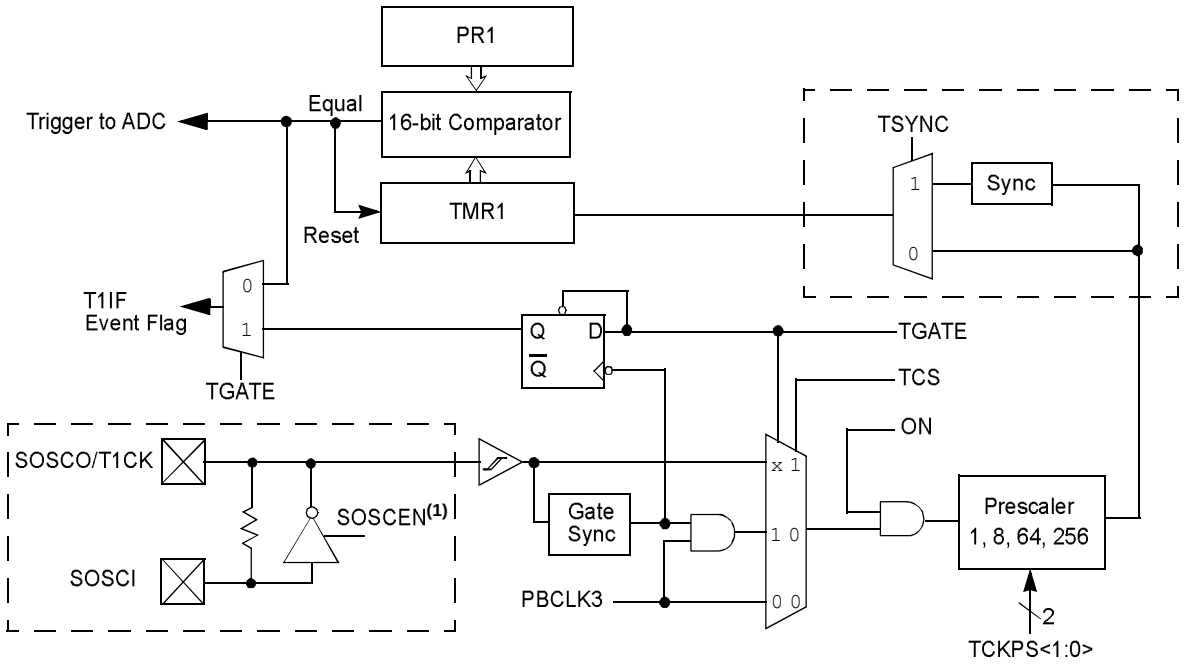

The following modes are supported by Timer1:

- Synchronous Internal Timer
- Synchronous Internal Gated Timer
- Synchronous External Timer
- Asynchronous External Timer

### 13.1 Additional Supported Features

- Selectable clock prescaler
- Timer operation during Sleep and Idle modes
- Fast bit manipulation using CLR, SET and INV registers
- Asynchronous mode can be used with the SOSC to function as a real-time clock
- ADC event trigger

**FIGURE 13-1: TIMER1 BLOCK DIAGRAM**

**Note 1:** The default state of the SOSCEN bit (OSCCON<1>) during a device Reset is controlled by the FSOSCEN bit in Configuration Word, DEVCFG1.

## 14.0 TIMER2/3, TIMER4/5, TIMER6/7, AND TIMER8/9

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 14. "Timers"** (DS60001105) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The PIC32MZ EF family of devices features eight synchronous 16-bit timers (default) that can operate as a free-running interval timer for various timing applications and counting external events.

The following modes are supported:

- Synchronous internal 16-bit timer
- Synchronous internal 16-bit gated timer
- Synchronous external 16-bit timer

Four 32-bit synchronous timers are available by combining Timer2 with Timer3, Timer4 with Timer5, Timer6 with Timer7, and Timer8 with Timer9.

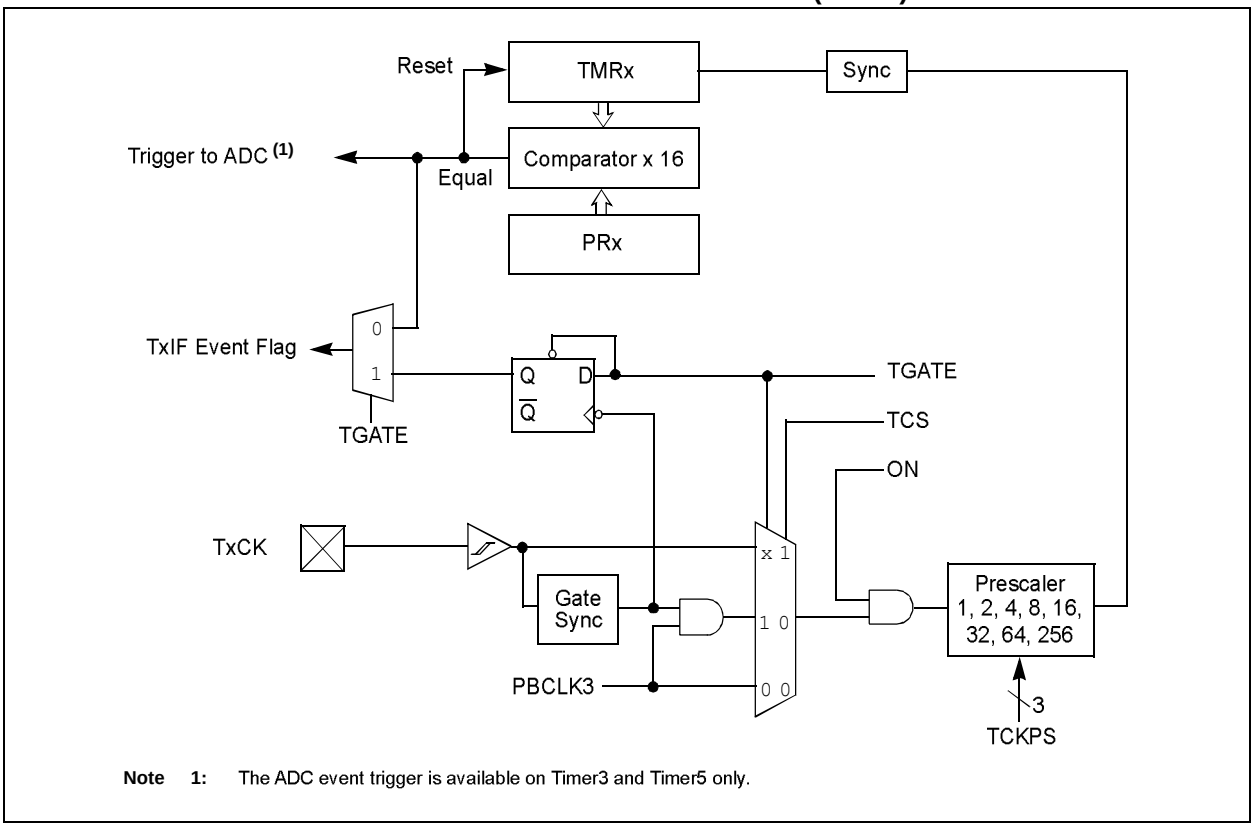

The 32-bit timers can operate in one of three modes:

- Synchronous internal 32-bit timer
- Synchronous internal 32-bit gated timer
- Synchronous external 32-bit timer

### 14.1 Additional Supported Features

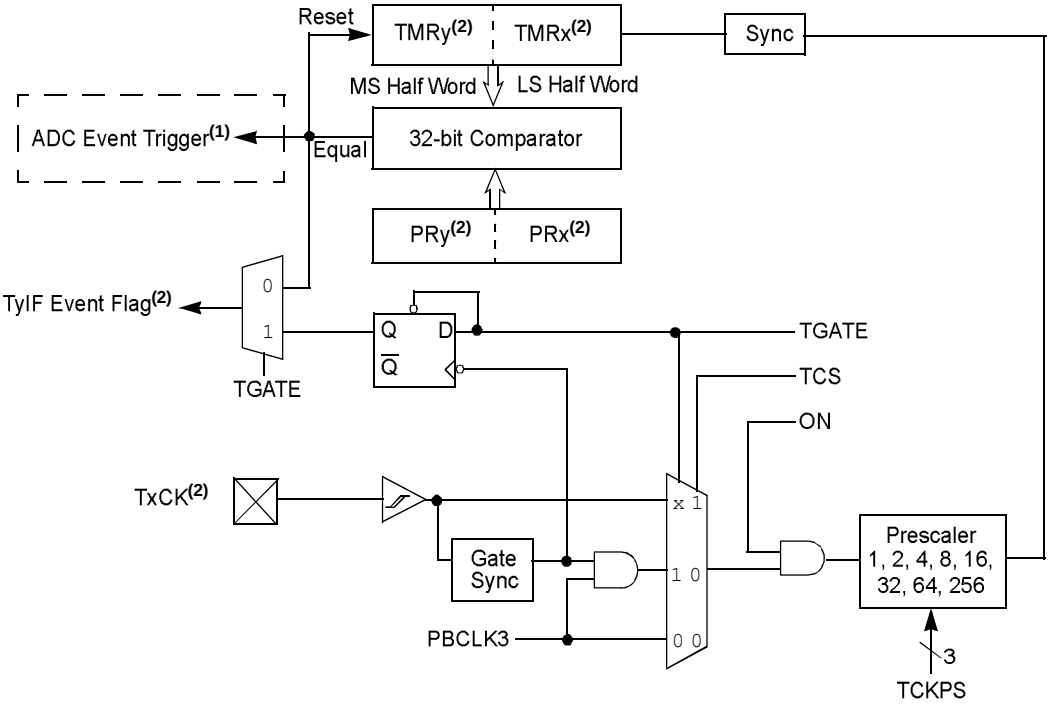

- Selectable clock prescaler
- Timers operational during CPU idle
- Time base for Input Capture and Output Compare modules (Timer2 through Timer7 only)
- ADC event trigger (Timer3 and Timer5 only)
- Fast bit manipulation using CLR, SET, and INV registers

**FIGURE 14-1: TIMER2 THROUGH TIMER9 BLOCK DIAGRAM (16-BIT)**

**Note 1:** The ADC event trigger is available on Timer3 and Timer5 only.

**FIGURE 14-2: TIMER2/3, TIMER4/5, TIMER6/7, AND TIMER8/9 BLOCK DIAGRAM (32-BIT)**

**Note 1:** ADC event trigger is available only on the Timer2/3 and TImer4/5 pairs.
**2:** In this diagram, 'x' represents Timer2, 4, 6, or 8, and 'y' represents Timer3, 5, 7, or 9.

## 15.0 DEADMAN TIMER (DMT)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

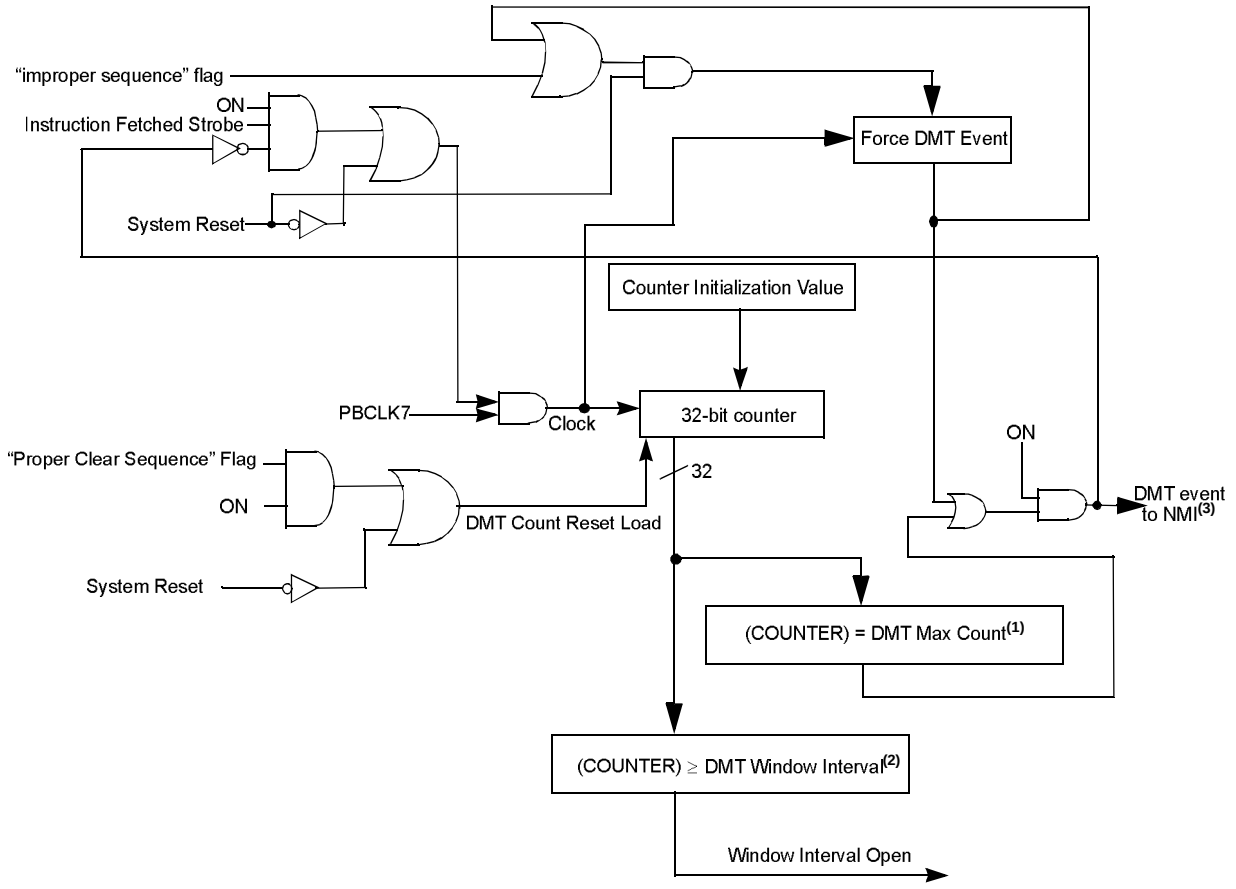

The primary function of the Deadman Timer (DMT) is to reset the processor in the event of a software malfunction. The DMT is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

The DMT consists of a 32-bit counter with a time-out count match value as specified by the DMTCNT<3:0> bits in the DEVCFG1 Configuration register.

A Deadman Timer is typically used in mission critical and safety critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 15-1 shows a block diagram of the Deadman Timer module.

**FIGURE 15-1: DEADMAN TIMER BLOCK DIAGRAM**

**Note 1:** DMT Max Count is controlled by the DMTCNT<3:0> bits in the DEVCFG1 Configuration register.
**2:** DMT Window Interval is controlled by the DMTINTV<2:0> bits in the DEVCFG1 Configuration register.
**3:** Refer to **Section 6.0 "Resets"** for more information.

## 16.0 WATCHDOG TIMER (WDT)

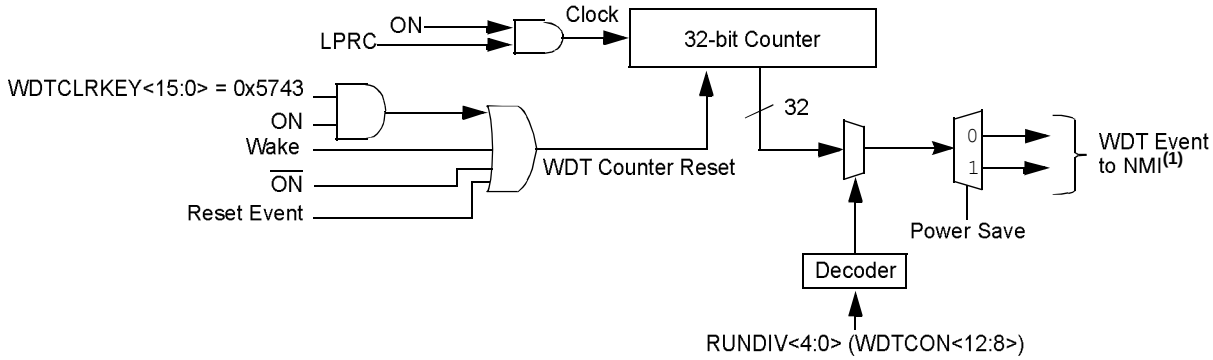

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. "Watchdog, Deadman, and Power-up Timers"** (DS60001114) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

When enabled, the Watchdog Timer (WDT) operates from the internal Low-Power Oscillator (LPRC) clock source and can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode.

The following are key features of the WDT module:

- Configuration or software controlled
- User-configurable time-out period
- Can wake the device from Sleep or Idle

**FIGURE 16-1: WATCHDOG TIMER BLOCK DIAGRAM**

**Note 1:** Refer to **6.0 "Resets"** for more information.

## 17.0 INPUT CAPTURE

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 15. "Input Capture"** (DS60001122) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Input Capture module is useful in applications requiring frequency (period) and pulse measurement.

The Input Capture module captures the 16-bit or 32-bit value of the selected Time Base registers when an event occurs at the ICx pin.

Capture events are caused by the following:

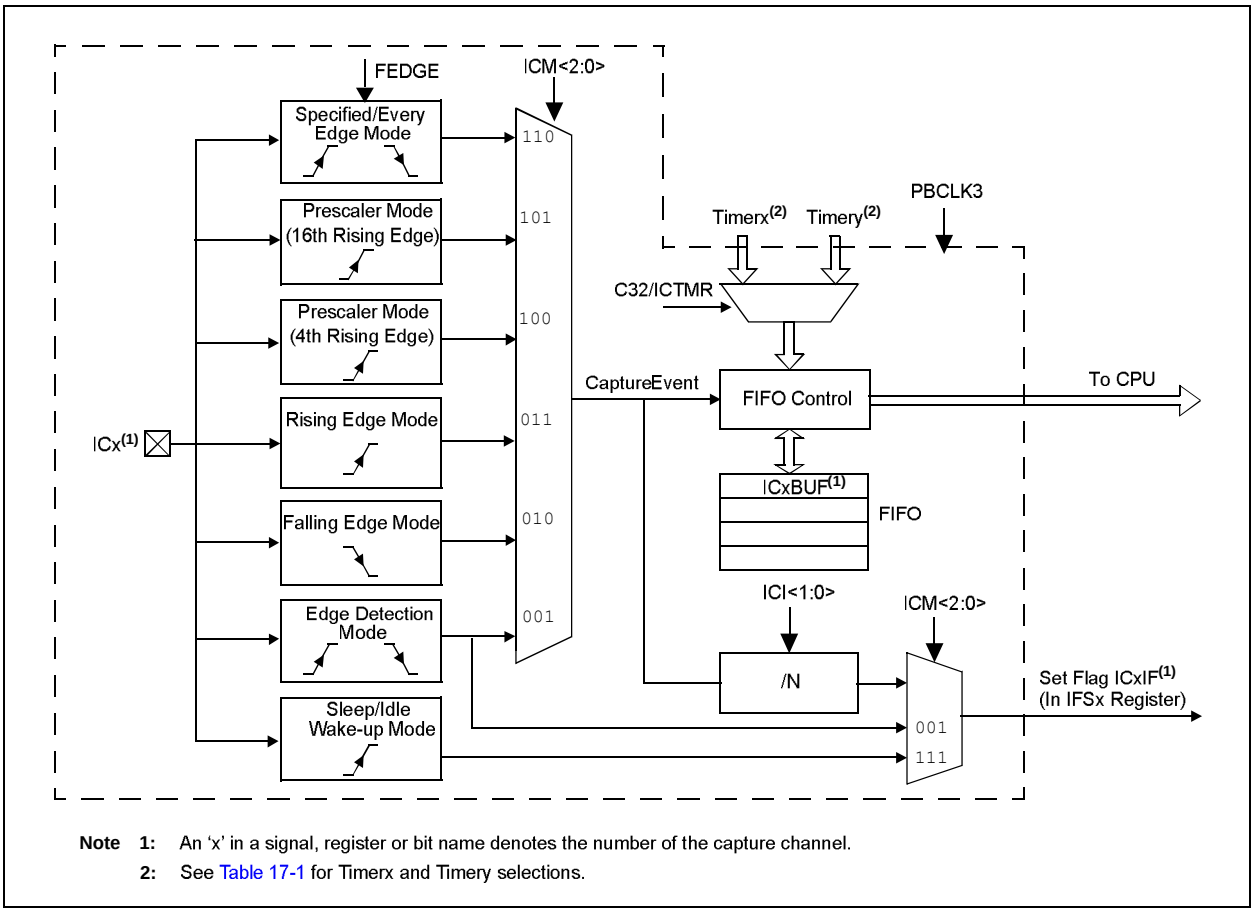

- Capture timer value on every edge (rising and falling), specified edge first
- Prescaler capture event modes:
  - Capture timer value on every 4th rising edge of input at ICx pin
  - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select between one of six 16-bit timers for the time base, or two of six 16-bit timers together to form a 32-bit timer. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values; Interrupt optionally generated after 1, 2, 3, or 4 buffer locations are filled
- Input capture can also be used to provide additional sources of external interrupts

**FIGURE 17-1: INPUT CAPTURE BLOCK DIAGRAM**

**Note 1:** An 'x' in a signal, register or bit name denotes the number of the capture channel.

**2:** See Table 17-1 for Timerx and Timery selections.

The timer source for each Input Capture module depends on the setting of the ICACLK bit in the CFGCON register. The available configurations are shown in Table 17-1.

## 18.0 OUTPUT COMPARE

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. "Output Compare"** (DS60001111) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

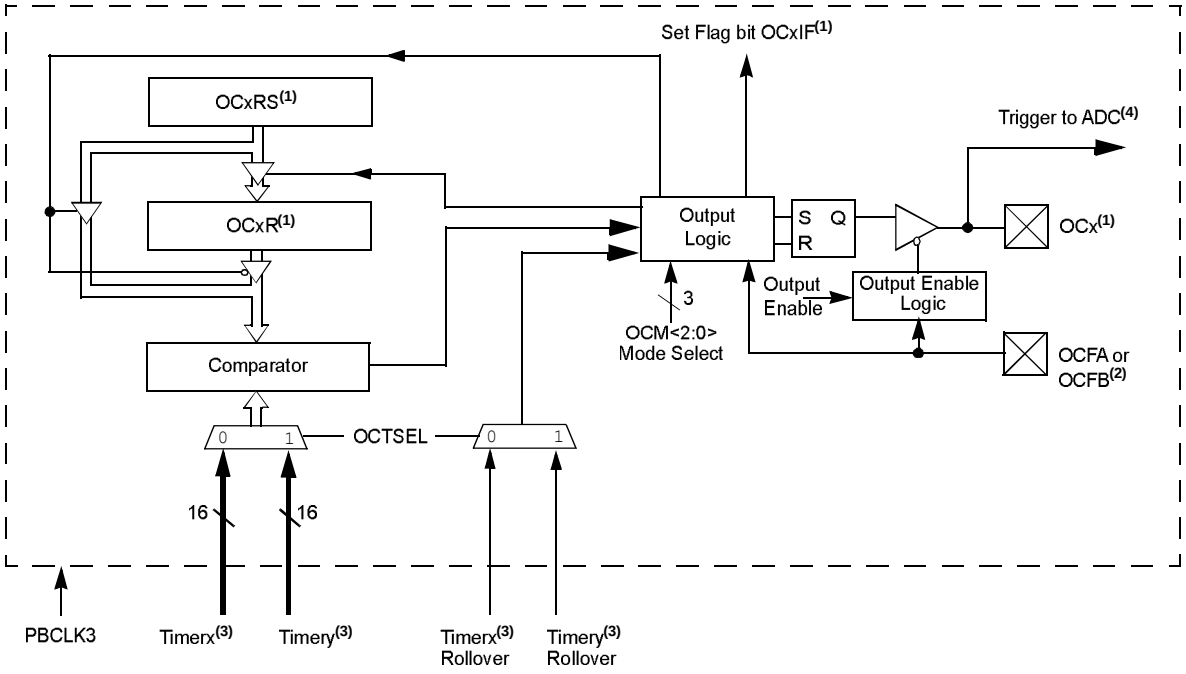

The Output Compare module is used to generate a single pulse or a train of pulses in response to selected time base events.

For all modes of operation, the Output Compare module compares the values stored in the OCxR and/or the OCxRS registers to the value in the selected timer. When a match occurs, the Output Compare module generates an event based on the selected mode of operation.

The following are key features of the Output Compare module:

- Multiple Output Compare modules in a device
- Programmable interrupt generation on compare event
- Single and Dual Compare modes
- Single and continuous output pulse generation
- Pulse-Width Modulation (PWM) mode
- Hardware-based PWM Fault detection and automatic output disable
- Programmable selection of 16-bit or 32-bit time bases
- Can operate from either of two available 16-bit time bases or a single 32-bit time base
- ADC event trigger

**FIGURE 18-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM**

**Note 1:** Where 'x' is shown, reference is made to the registers associated with the respective output compare channels, 1 through 9.

**2:** The OCFA pin controls the OC1, OC3, and OC7-OC9 channels. The OCFB pin controls the OC4-OC6 channels.

**3:** Refer to Table 18-1 for Timerx and Timery selections.

**4:** The ADC event trigger is only available on OC1, OC3, and OC 5.

The timer source for each Output Compare module depends on the setting of the OCACLK bit in the CFGCON register. The available configurations are shown in Table 18-1.

## 19.0 SERIAL PERIPHERAL INTERFACE (SPI) AND INTER-IC SOUND ($I^2S$)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 23. "Serial Peripheral Interface (SPI)"** (DS60001106) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

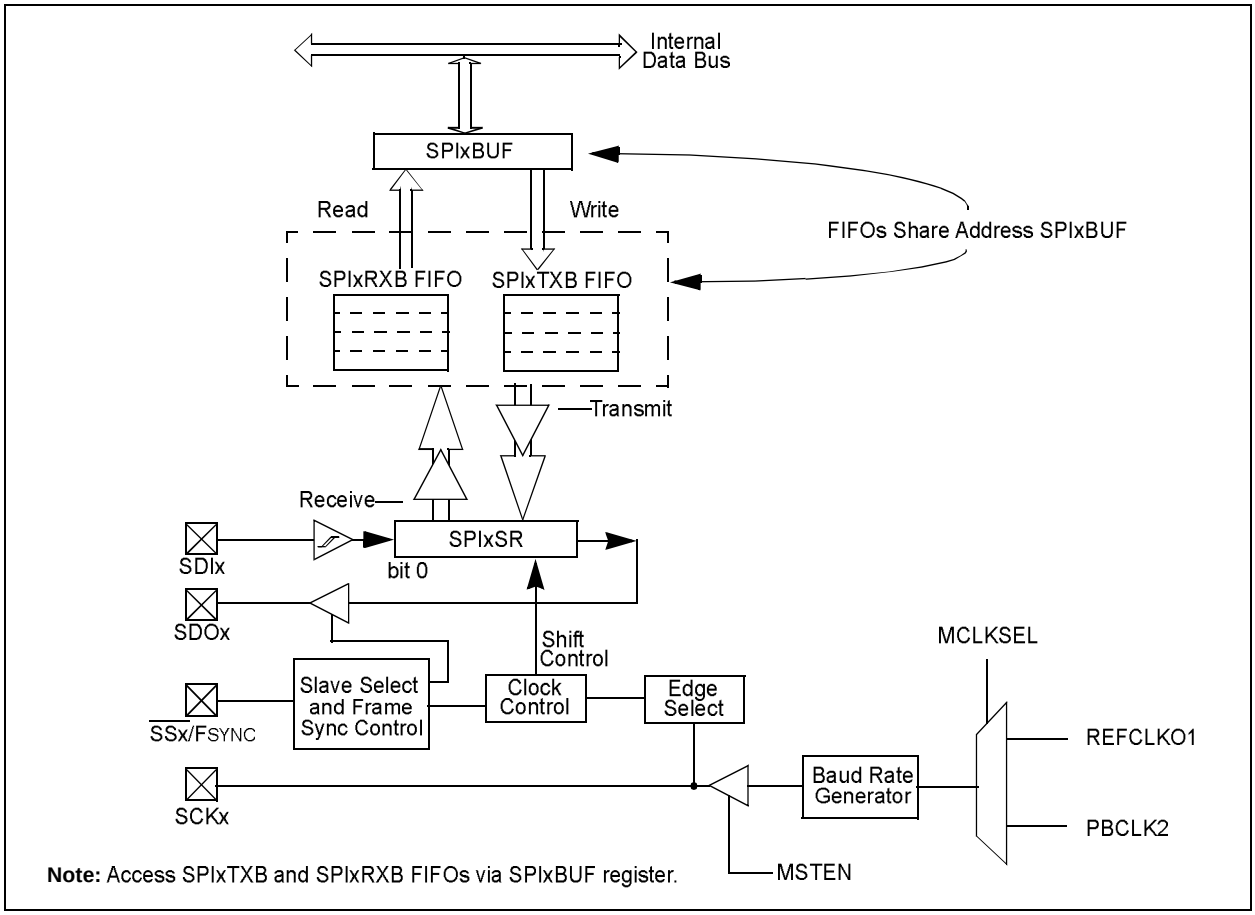

The SPI/$I^2S$ module is a synchronous serial interface that is useful for communicating with external peripherals and other microcontroller devices, as well as digital audio devices. These peripheral devices may be Serial EEPROMs, Shift registers, display drivers, Analog-to-Digital Converters, and so on.

The SPI/$I^2S$ module is compatible with Motorola® SPI and SIOP interfaces.

The following are key features of the SPI module:

- Master and Slave modes support
- Four different clock formats
- Enhanced Framed SPI protocol support
- User-configurable 8-bit, 16-bit and 32-bit data width
- Separate SPI FIFO buffers for receive and transmit
  - FIFO buffers act as 4/8/16-level deep FIFOs based on 32/16/8-bit data width
- Programmable interrupt event on every 8-bit, 16-bit and 32-bit data transfer
- Operation during Sleep and Idle modes
- Audio Codec Support:
  - $I^2S$ protocol
  - Left-justified
  - Right-justified
  - PCM

|---|---|---|---|
| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 31 **FRMEN:** Framed SPI Support bit
1 = Framed SPI support is enabled ($\overline{SSx}$ pin used as FSYNC input/output)
0 = Framed SPI support is disabled

bit 30 **FRMSYNC:** Frame Sync Pulse Direction Control on $\overline{SSx}$ pin bit (Framed SPI mode only)
1 = Frame sync pulse input (Slave mode)
0 = Frame sync pulse output (Master mode)

bit 29 **FRMPOL:** Frame Sync / Slave Select Polarity bit (Framed SPI or Master Transmit modes only)
1 = Frame pulse or $\overline{SSx}$ pin is active-high
0 = Frame pulse or $\overline{SSx}$ is active-low

bit 28 **MSSEN:** Master Mode Slave Select Enable bit
1 = Slave select SPI support is enabled. The $\overline{SS}$ pin is automatically driven during transmission in Master mode. Polarity is determined by the FRMPOL bit.
0 = Slave select SPI support is disabled.

bit 27 **FRMSYPW:** Frame Sync Pulse Width bit
1 = Frame sync pulse is one character wide
0 = Frame sync pulse is one clock wide

bit 26-24 **FRMCNT<2:0>:** Frame Sync Pulse Counter bits. Controls the number of data characters transmitted per pulse. This bit is only valid in Framed mode.
111 = Reserved
110 = Reserved
101 = Generate a frame sync pulse on every 32 data characters
100 = Generate a frame sync pulse on every 16 data characters
011 = Generate a frame sync pulse on every 8 data characters
010 = Generate a frame sync pulse on every 4 data characters
001 = Generate a frame sync pulse on every 2 data characters
000 = Generate a frame sync pulse on every data character

bit 23 **MCLKSEL:** Master Clock Enable bit(1)
1 = REFCLKO1 is used by the Baud Rate Generator
0 = PBCLK2 is used by the Baud Rate Generator

bit 22-18 **Unimplemented:** Read as '0'

**Note 1:** This bit can only be written when the ON bit = 0. Refer to **Section 37.0 "Electrical Characteristics"** for maximum clock frequency requirements.

**2:** This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

**3:** When AUDEN = 1, the SPI/$I^2S$ module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

**4:** This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

**REGISTER 19-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)**

bit 17 **SPIFE:** Frame Sync Pulse Edge Select bit (Framed SPI mode only)
1 = Frame synchronization pulse coincides with the first bit clock
0 = Frame synchronization pulse precedes the first bit clock

bit 16 **ENHBUF:** Enhanced Buffer Enable bit(1)
1 = Enhanced Buffer mode is enabled
0 = Enhanced Buffer mode is disabled

bit 15 **ON:** SPI/I2S Module On bit
1 = SPI/I2S module is enabled
0 = SPI/I2S module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue operation when CPU enters in Idle mode
0 = Continue operation in Idle mode

bit 12 **DISSDO:** Disable SDOx pin bit(4)
1 = SDOx pin is not used by the module. Pin is controlled by associated PORT register
0 = SDOx pin is controlled by the module

bit 11-10 **MODE<32,16>:** 32/16-Bit Communication Select bits

When AUDEN = 1:

| MODE32 | MODE16 | Communication |
|---|---|---|
| 1 | 1 | 24-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame |
| 1 | 0 | 32-bit Data, 32-bit FIFO, 32-bit Channel/64-bit Frame |
| 0 | 1 | 16-bit Data, 16-bit FIFO, 32-bit Channel/64-bit Frame |
| 0 | 0 | 16-bit Data, 16-bit FIFO, 16-bit Channel/32-bit Frame |

When AUDEN = 0:

| MODE32 | MODE16 | Communication |
|---|---|---|
| 1 | x | 32-bit |
| 0 | 1 | 16-bit |
| 0 | 0 | 8-bit |

bit 9 **SMP:** SPI Data Input Sample Phase bit
Master mode (MSTEN = 1):
1 = Input data sampled at end of data output time
0 = Input data sampled at middle of data output time
Slave mode (MSTEN = 0):
SMP value is ignored when SPI is used in Slave mode. The module always uses SMP = 0.

bit 8 **CKE:** SPI Clock Edge Select bit(2)
1 = Serial output data changes on transition from active clock state to Idle clock state (see CKP bit)
0 = Serial output data changes on transition from Idle clock state to active clock state (see CKP bit)

bit 7 **SSEN:** Slave Select Enable (Slave mode) bit
1 = $\overline{SSx}$ pin is used for Slave mode
0 = $\overline{SSx}$ pin is not used for Slave mode, pin is controlled by the port function.

bit 6 **CKP:** Clock Polarity Select bit(3)
1 = Idle state for clock is a high level; active state is a low level
0 = Idle state for clock is a low level; active state is a high level

**Note 1:** This bit can only be written when the ON bit = 0. Refer to **Section 37.0 "Electrical Characteristics"** for maximum clock frequency requirements.

**2:** This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

**3:** When AUDEN = 1, the SPI/I2S module functions as if the CKP bit is equal to '1', regardless of the actual value of the CKP bit.

**4:** This bit present for legacy compatibility and is superseded by PPS functionality on these devices (see **Section 12.4 "Peripheral Pin Select (PPS)"** for more information).

**REGISTER 19-1: SPIxCON: SPI CONTROL REGISTER (CONTINUED)**

bit 5 **MSTEN:** Master Mode Enable bit
1 = Master mode
0 = Slave mode

bit 4 **DISSDI:** Disable SDI bit(4)
1 = SDI pin is not used by the SPI module (pin is controlled by PORT function)
0 = SDI pin is controlled by the SPI module

bit 3-2 **STXISEL<1:0>:** SPI Transmit Buffer Empty Interrupt Mode bits
11 = Interrupt is generated when the buffer is not full (has one or more empty elements)
10 = Interrupt is generated when the buffer is empty by one-half or more
01 = Interrupt is generated when the buffer is completely empty
00 = Interrupt is generated when the last transfer is shifted out of SPISR and transmit operations are complete

bit 1-0 **SRXISEL<1:0>:** SPI Receive Buffer Full Interrupt Mode bits
11 = Interrupt is generated when the buffer is full
10 = Interrupt is generated when the buffer is full by one-half or more
01 = Interrupt is generated when the buffer is not empty
00 = Interrupt is generated when the last word in the receive buffer is read (i.e., buffer is empty)

**Note 1:** This bit can only be written when the ON bit = 0. Refer to **Section 37.0 "Electrical Characteristics"** for maximum clock frequency requirements.

**2:** This bit is not used in the Framed SPI mode. The user should program this bit to '0' for the Framed SPI mode (FRMEN = 1).

1 = Transmit buffer has encountered an underrun condition
0 = Transmit buffer has no underrun condition
This bit is only valid in Framed Sync mode; the underrun condition must be cleared by disabling/re-enabling the module.

bit 7 **SRMT:** Shift Register Empty bit (valid only when ENHBUF = 1)
1 = When SPI module shift register is empty
0 = When SPI module shift register is not empty

bit 6 **SPIROV:** Receive Overflow Flag bit
1 = A new data is completely received and discarded. The user software has not read the previous data in the SPIxBUF register.
0 = No overflow has occurred
This bit is set in hardware; can only be cleared (= 0) in software.

bit 5 **SPIRBE:** RX FIFO Empty bit (valid only when ENHBUF = 1)
1 = RX FIFO is empty (CRPTR = SWPTR)
0 = RX FIFO is not empty (CRPTR ≠ SWPTR)

bit 4 **Unimplemented:** Read as '0'

**REGISTER 19-3: SPIxSTAT: SPI STATUS REGISTER**

bit 3 **SPITBE:** SPI Transmit Buffer Empty Status bit

1 = Transmit buffer, SPIxTXB is empty
0 = Transmit buffer, SPIxTXB is not empty

Automatically set in hardware when SPI transfers data from SPIxTXB to SPIxSR.

Automatically cleared in hardware when SPIxBUF is written to, loading SPIxTXB.

bit 2 **Unimplemented:** Read as '0'

bit 1 **SPITBF:** SPI Transmit Buffer Full Status bit

1 = Transmit is not yet started, SPITXB is full
0 = Transmit buffer is not full

Standard Buffer Mode:

Automatically set in hardware when the core writes to the SPIBUF location, loading SPITXB.
Automatically cleared in hardware when the SPI module transfers data from SPITXB to SPISR.

Enhanced Buffer Mode:

Set when CWPTR + 1 = SRPTR; cleared otherwise

bit 0 **SPIRBF:** SPI Receive Buffer Full Status bit

1 = Receive buffer, SPIxRXB is full
0 = Receive buffer, SPIxRXB is not full

Standard Buffer Mode:

Automatically set in hardware when the SPI module transfers data from SPIxSR to SPIxRXB.
Automatically cleared in hardware when SPIxBUF is read from, reading SPIxRXB.

Enhanced Buffer Mode:

Set when SWPTR + 1 = CRPTR; cleared otherwise

## 20.0 SERIAL QUAD INTERFACE (SQI)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 46. "Serial Quad Interface (SQI)"** (DS60001244) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

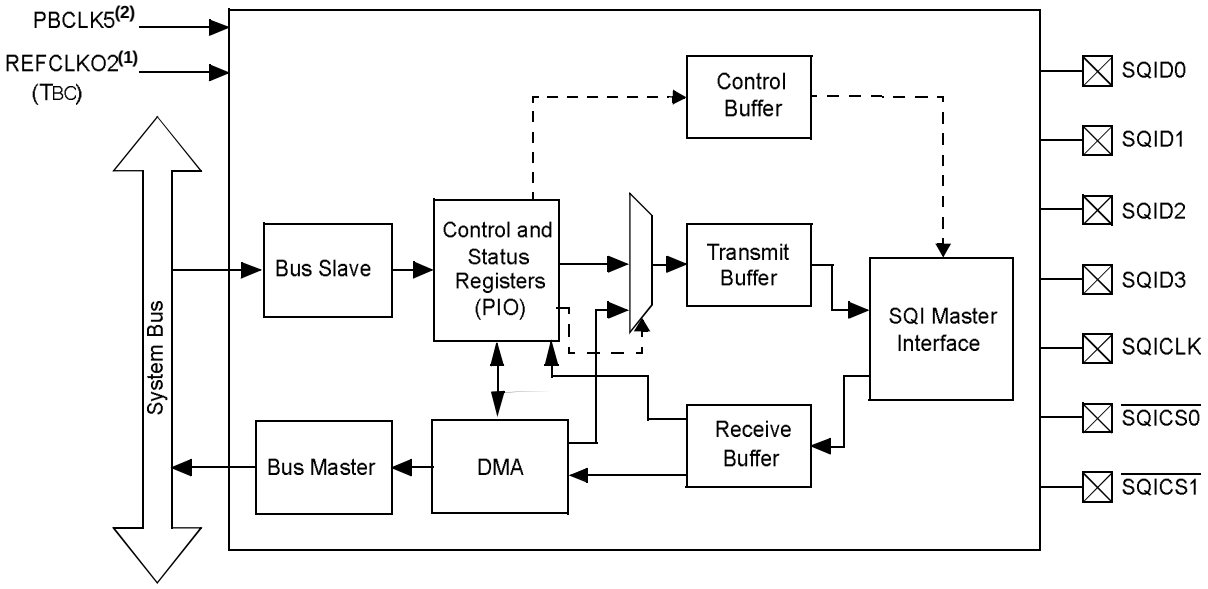

The SQI module is a synchronous serial interface that provides access to serial Flash memories and other serial devices. The SQI module supports Single Lane (identical to SPI), Dual Lane, and Quad Lane modes.

The following are key feature of the SQI module:

- Supports Single, Dual, and Quad Lane modes
- Supports Single Data Rate (SDR) mode
- Programmable command sequence
- eXecute-In-Place (XIP)
- Data transfer:
  - Programmed I/O mode (PIO)
  - Buffer descriptor DMA
- Supports SPI Mode 0 and Mode 3
- Programmable Clock Polarity (CPOL) and Clock Phase (CPHA) bits
- Supports up to two Chip Selects
- Supports up to four bytes of Flash address
- Programmable interrupt thresholds
- 32-byte transmit data buffer
- 32-byte receive data buffer
- 4-word controller buffer

**Note:** Once the SQI module is configured, external devices are memory mapped into KSEG2 and KSEG3 (see Figure 4-1 through Figure 4-4 in **Section 4.0 "Memory Organization"** for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"* for more information).

**FIGURE 20-1: SQI MODULE BLOCK DIAGRAM**

**Note 1:** When configuring the REFCLKO2 clock source, a value of '0' for the ROTRIM<8:0> bits must be selected.
**2:** This clock source is only used for SQI Special Function Register (SFR) access.

Setting these bits to '00000000000' specifies the highest frequency of the SQI clock.

bit 7-2 **Unimplemented:** Read as '0'

bit 1 **STABLE:** TSQI Clock Stable Select bit

This bit is set to '1' when the SQI clock, TSQI, is stable after writing a '1' to the EN bit.
1 = TSQI clock is stable
0 = TSQI clock is not stable

bit 0 **EN:** TSQI Clock Enable Select bit

When clock oscillation is stable, the SQI module will set the STABLE bit to '1'.
1 = Enable the SQI clock (TSQI) (when clock oscillation is stable, the SQI module sets the STABLE bit to '1')
0 = Disable the SQI clock (TSQI) (the SQI module should stop its clock to enter a low power state); SFRs can still be accessed, as they use PBCLK5

**Note 1:** Refer to Table 37-34 in **37.0 "Electrical Characteristics"** for the maximum clock frequency specifications.

bit 31-13 **Unimplemented:** Read as '0'

bit 12-8 **TXCMDTHR<4:0>:** Transmit Command Threshold bits

In transmit initiation mode, the SQI module performs a transmit operation when transmit command threshold bytes are present in the TX FIFO. These bits should usually be set to '1' for normal Flash commands, and set to a higher value for page programming. For 16-bit mode, the value should be a multiple of 2.

bit 7-5 **Unimplemented:** Read as '0'

bit 4-0 **RXCMDTHR<4:0>:** Receive Command Threshold bits(1)

In receive initiation mode, the SQI module attempts to perform receive operations to fetch the receive command threshold number of bytes in the receive buffer. If space for these bytes is not present in the FIFO, the SQI will not initiate a transfer. For 16-bit mode, the value should be a multiple of 2.

If software performs any reads, thereby reducing the FIFO count, hardware would initiate a receive transfer to make the FIFO count equal to the value in these bits. If software would not like any more words latched into the FIFO, command initiation mode needs to be changed to Idle before any FIFO reads by software.

In the case of Boot/XIP mode, the SQI module will use the System Bus burst size, instead of the receive command threshold value.

**Note 1:** These bits should only be programmed when a receive is not active (i.e., during Idle mode or a transmit).

## 21.0 INTER-INTEGRATED CIRCUIT ($I^2C$)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 24. "Inter-Integrated Circuit ($I^2C$)"** (DS60001116) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The $I^2C$ module provides complete hardware support for both Slave and Multi-Master modes of the $I^2C$ serial communication standard.

Each $I^2C$ module has a 2-pin interface:

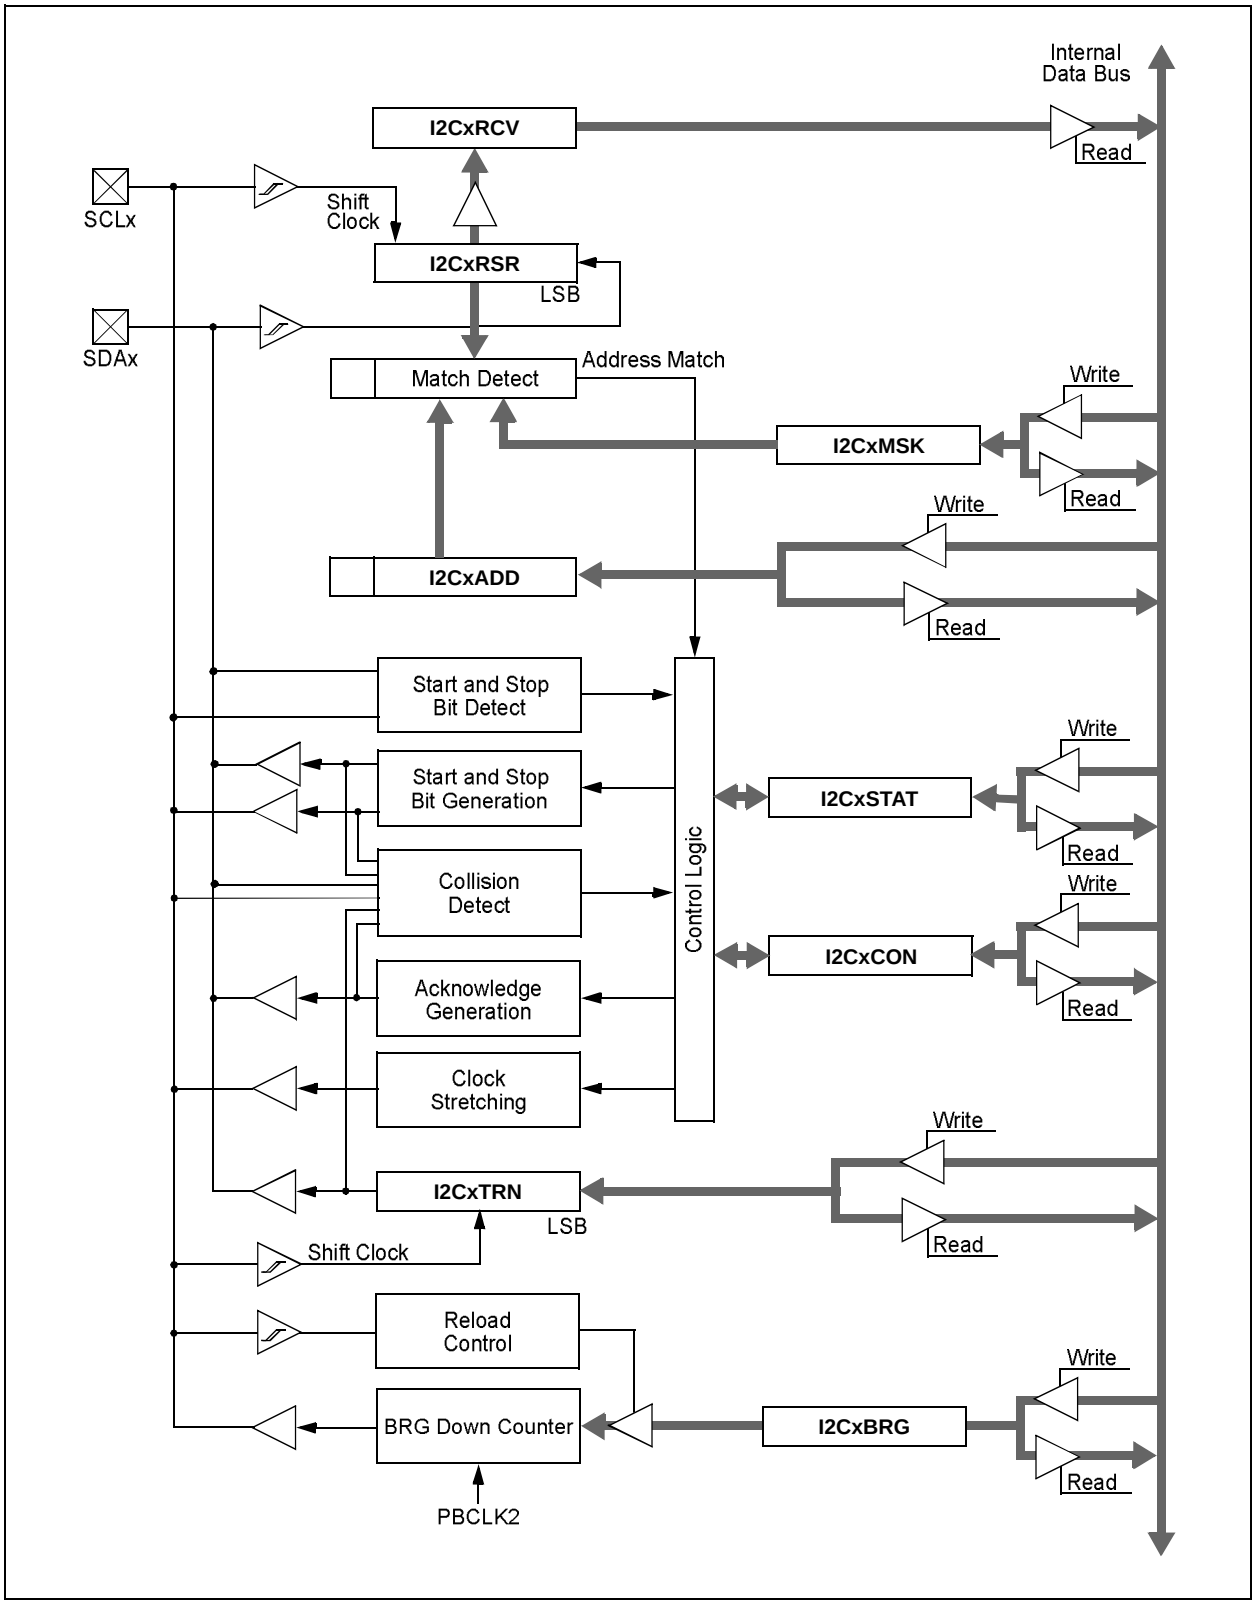

- SCLx pin is clock
- SDAx pin is data

Each $I^2C$ module offers the following key features:

- $I^2C$ interface supporting both master and slave operation
- $I^2C$ Slave mode supports 7-bit and 10-bit addressing
- $I^2C$ Master mode supports 7-bit and 10-bit addressing
- $I^2C$ port allows bidirectional transfers between master and slaves
- Serial clock synchronization for the $I^2C$ port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- $I^2C$ supports multi-master operation; detects bus collision and arbitrates accordingly
- Provides support for address bit masking
- SMBus support

Figure 21-1 illustrates the $I^2C$ module block diagram.

bit 31-23 **Unimplemented:** Read as '0'

bit 22 **PCIE:** Stop Condition Interrupt Enable bit (I²C Slave mode only)
- 1 = Enable interrupt on detection of Stop condition
- 0 = Stop detection interrupts are disabled

bit 21 **SCIE:** Start Condition Interrupt Enable bit (I²C Slave mode only)
- 1 = Enable interrupt on detection of Start or Restart conditions
- 0 = Start detection interrupts are disabled

bit 20 **BOEN:** Buffer Overwrite Enable bit (I²C Slave mode only)
- 1 = I2CxRCV is updated and $\overline{ACK}$ is generated for a received address/data byte, ignoring the state of the I2COV bit (I2CxSTAT<6>)only if the RBF bit (I2CxSTAT<2>) = 0
- 0 = I2CxRCV is only updated when the I2COV bit (I2CxSTAT<6>) is clear

bit 19 **SDAHT:** SDA Hold Time Selection bit
- 1 = Minimum of 300 ns hold time on SDA after the falling edge of SCL
- 0 = Minimum of 100 ns hold time on SDA after the falling edge of SCL

bit 18 **SBCDE:** Slave Mode Bus Collision Detect Enable bit (I²C Slave mode only)
- 1 = Enable slave bus collision interrupts
- 0 = Slave bus collision interrupts are disabled

bit 18 **AHEN:** Address Hold Enable bit (Slave mode only)
- 1 = Following the 8th falling edge of SCL for a matching received address byte; SCKREL bit will be cleared and the SCL will be held low.
- 0 = Address holding is disabled

bit 16 **DHEN:** Data Hold Enable bit (I²C Slave mode only)
- 1 = Following the 8th falling edge of SCL for a received data byte; slave hardware clears the SCKREL bit and SCL is held low
- 0 = Data holding is disabled

bit 15 **ON:** I²C Enable bit
- 1 = Enables the I²C module and configures the SDA and SCL pins as serial port pins
- 0 = Disables the I²C module; all I²C pins are controlled by PORT functions

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
- 1 = Discontinue module operation when device enters Idle mode
- 0 = Continue module operation in Idle mode

**REGISTER 21-1: I2CxCON: I²C CONTROL REGISTER (CONTINUED)**

bit 12 **SCLREL:** SCLx Release Control bit (when operating as I²C slave)
1 = Release SCLx clock
0 = Hold SCLx clock low (clock stretch)
If STREN = 1:
Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware clear at beginning of slave transmission. Hardware clear at end of slave reception.
If STREN = 0:
Bit is R/S (i.e., software can only write '1' to release clock). Hardware clear at beginning of slave transmission.

bit 11 **STRICT:** Strict I²C Reserved Address Rule Enable bit
1 = Strict reserved addressing is enforced. Device does not respond to reserved address space or generate addresses in reserved address space.
0 = Strict I²C Reserved Address Rule is not enabled

bit 10 **A10M:** 10-bit Slave Address bit
1 = I2CxADD is a 10-bit slave address
0 = I2CxADD is a 7-bit slave address

bit 9 **DISSLW:** Disable Slew Rate Control bit
1 = Slew rate control is disabled
0 = Slew rate control is enabled

bit 8 **SMEN:** SMBus Input Levels bit
1 = Enable I/O pin thresholds compliant with SMBus specification
0 = Disable SMBus input thresholds

bit 7 **GCEN:** General Call Enable bit (when operating as I²C slave)
1 = Enable interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)
0 = General call address is disabled

bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I²C slave)
Used in conjunction with SCLREL bit.
1 = Enable software or receive clock stretching
0 = Disable software or receive clock stretching

bit 5 **ACKDT:** Acknowledge Data bit (when operating as I²C master, applicable during master receive)
Value that is transmitted when the software initiates an Acknowledge sequence.
1 = Send NACK during Acknowledge
0 = Send ACK during Acknowledge

bit 4 **ACKEN:** Acknowledge Sequence Enable bit
(when operating as I²C master, applicable during master receive)
1 = Initiate Acknowledge sequence on SDAx and SCLx pins and transmit ACKDT data bit. Hardware clear at end of master Acknowledge sequence.
0 = Acknowledge sequence not in progress

bit 3 **RCEN:** Receive Enable bit (when operating as I²C master)
1 = Enables Receive mode for I²C. Hardware clear at end of eighth bit of master receive data byte.
0 = Receive sequence not in progress

bit 2 **PEN:** Stop Condition Enable bit (when operating as I²C master)
1 = Initiate Stop condition on SDAx and SCLx pins. Hardware clear at end of master Stop sequence.
0 = Stop condition not in progress

bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I²C master)
1 = Initiate Repeated Start condition on SDAx and SCLx pins. Hardware clear at end of master Repeated Start sequence.
0 = Repeated Start condition not in progress

bit 0 **SEN:** Start Condition Enable bit (when operating as I²C master)
1 = Initiate Start condition on SDAx and SCLx pins. Hardware clear at end of master Start sequence.
0 = Start condition not in progress

bit 31-16 **Unimplemented:** Read as '0'

bit 15 **ACKSTAT:** Acknowledge Status bit
(when operating as I²C master, applicable to master transmit operation)
1 = NACK received from slave
0 = ACK received from slave
Hardware set or clear at end of slave Acknowledge.

bit 14 **TRSTAT:** Transmit Status bit (when operating as I²C master, applicable to master transmit operation)
1 = Master transmit is in progress (8 bits + ACK)
0 = Master transmit is not in progress
Hardware set at beginning of master transmission. Hardware clear at end of slave Acknowledge.

bit 13 **ACKTIM:** Acknowledge Time Status bit (Valid in I²C Slave mode only)
1 = I²C bus is in an Acknowledge sequence, set on the eight falling edge of SCL clock
0 = Not an Acknowledge sequence, cleared on 9th rising edge of SCL clock

bit 12-11 **Unimplemented:** Read as '0'

bit 10 **BCL:** Master Bus Collision Detect bit
1 = A bus collision has been detected during a master operation
0 = No collision
Hardware set at detection of bus collision.

bit 9 **GCSTAT:** General Call Status bit
1 = General call address was received
0 = General call address was not received
Hardware set when address matches general call address. Hardware clear at Stop detection.

bit 8 **ADD10:** 10-bit Address Status bit
1 = 10-bit address was matched
0 = 10-bit address was not matched
Hardware set at match of 2nd byte of matched 10-bit address. Hardware clear at Stop detection.

bit 7 **IWCOL:** Write Collision Detect bit
1 = An attempt to write the I2CxTRN register failed because the I²C module is busy
0 = No collision
Hardware set at occurrence of write to I2CxTRN while busy (cleared by software).

bit 6 **I2COV:** Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register is still holding the previous byte
0 = No overflow
Hardware set at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).

**REGISTER 21-2: I2CxSTAT: I$^2$C STATUS REGISTER (CONTINUED)**

bit 5 **D_A:** Data/Address bit (when operating as I$^2$C slave)
1 = Indicates that the last byte received was data
0 = Indicates that the last byte received was device address
Hardware clear at device address match. Hardware set by reception of slave byte.

bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware set or clear when Start, Repeated Start or Stop detected.

bit 3 **S:** Start bit
1 = Indicates that a Start (or Repeated Start) bit has been detected last
0 = Start bit was not detected last
Hardware set or clear when Start, Repeated Start or Stop detected.

bit 2 **R_W:** Read/Write Information bit (when operating as I$^2$C slave)
1 = Read – indicates data transfer is output from slave
0 = Write – indicates data transfer is input to slave
Hardware set or clear after reception of I$^2$C device address byte.

bit 1 **RBF:** Receive Buffer Full Status bit
1 = Receive complete, I2CxRCV is full
0 = Receive not complete, I2CxRCV is empty
Hardware set when I2CxRCV is written with received byte. Hardware clear when software reads I2CxRCV.

bit 0 **TBF:** Transmit Buffer Full Status bit
1 = Transmit in progress, I2CxTRN is full
0 = Transmit complete, I2CxTRN is empty
Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

## 22.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. "Universal Asynchronous Receiver Transmitter (UART)"** (DS60001107) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

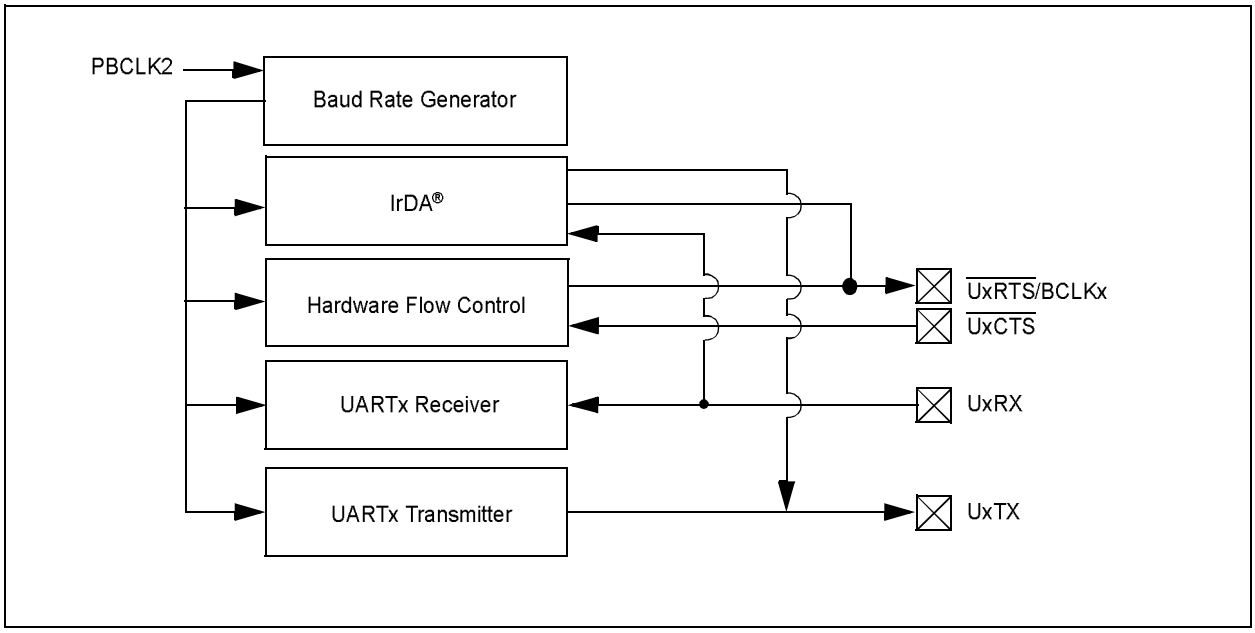

The UART module is one of the serial I/O modules available in the PIC32MZ EF family of devices. The UART is a full-duplex, asynchronous communication channel that communicates with peripheral devices and personal computers through protocols, such as RS-232, RS-485, LIN, and IrDA®. The module also supports the hardware flow control option, with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins, and also includes an IrDA encoder and decoder.

The primary features of the UART module are:

- Full-duplex, 8-bit or 9-bit data transmission
- Even, Odd or No Parity options (for 8-bit data)
- One or two Stop bits
- Hardware auto-baud feature
- Hardware flow control option
- Fully integrated Baud Rate Generator (BRG) with 16-bit prescaler
- Baud rates ranging from 76 bps to 25 Mbps at 100 MHz (PBCLK2)
- 8-level deep First-In-First-Out (FIFO) transmit data buffer
- 8-level deep FIFO receive data buffer
- Parity, framing and buffer overrun error detection
- Support for interrupt-only on address detect (9th bit = 1)
- Separate transmit and receive interrupts
- Loopback mode for diagnostic support
- LIN Protocol support
- IrDA encoder and decoder with 16x baud clock output for external IrDA encoder/decoder support

Figure 22-1 illustrates a simplified block diagram of the UART module.

bit 31-25 **Unimplemented:** Read as '0'

bit 24 **ADM_EN:** Automatic Address Detect Mode Enable bit
- 1 = Automatic Address Detect mode is enabled
- 0 = Automatic Address Detect mode is disabled

bit 23-16 **ADDR<7:0>:** Automatic Address Mask bits

When the ADM_EN bit is '1', this value defines the address character to use for automatic address detection.

bit 15-14 **UTXISEL<1:0>:** TX Interrupt Mode Selection bits
- 11 = Reserved, do not use
- 10 = Interrupt is generated and asserted while the transmit buffer is empty
- 01 = Interrupt is generated and asserted when all characters have been transmitted
- 00 = Interrupt is generated and asserted while the transmit buffer contains at least one empty space

bit 13 **UTXINV:** Transmit Polarity Inversion bit

If IrDA mode is disabled (i.e., IREN (UxMODE<12>) is '0'):
- 1 = UxTX Idle state is '0'
- 0 = UxTX Idle state is '1'

If IrDA mode is enabled (i.e., IREN (UxMODE<12>) is '1'):
- 1 = IrDA encoded UxTX Idle state is '1'
- 0 = IrDA encoded UxTX Idle state is '0'

bit 12 **URXEN:** Receiver Enable bit
- 1 = UARTx receiver is enabled. UxRX pin is controlled by UARTx (if ON = 1)
- 0 = UARTx receiver is disabled. UxRX pin is ignored by the UARTx module

bit 11 **UTXBRK:** Transmit Break bit
- 1 = Send Break on next transmission. Start bit followed by twelve '0' bits, followed by Stop bit; cleared by hardware upon completion
- 0 = Break transmission is disabled or completed

bit 10 **UTXEN:** Transmit Enable bit
- 1 = UARTx transmitter is enabled. UxTX pin is controlled by UARTx (if ON = 1)
- 0 = UARTx transmitter is disabled. Any pending transmission is aborted and buffer is reset

bit 9 **UTXBF:** Transmit Buffer Full Status bit (read-only)
- 1 = Transmit buffer is full
- 0 = Transmit buffer is not full, at least one more character can be written

bit 8 **TRMT:** Transmit Shift Register is Empty bit (read-only)
- 1 = Transmit shift register is empty and transmit buffer is empty (the last transmission has completed)
- 0 = Transmit shift register is not empty, a transmission is in progress or queued in the transmit buffer

**REGISTER 22-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)**

bit 7-6 **URXISEL<1:0>:** Receive Interrupt Mode Selection bit
11 = Reserved
10 = Interrupt flag bit is asserted while receive buffer is 3/4 or more full
01 = Interrupt flag bit is asserted while receive buffer is 1/2 or more full
00 = Interrupt flag bit is asserted while receive buffer is not empty (i.e., has at least 1 data character)

bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)
1 = Address Detect mode is enabled. If 9-bit mode is not selected, this control bit has no effect
0 = Address Detect mode is disabled

bit 4 **RIDLE:** Receiver Idle bit (read-only)
1 = Receiver is Idle
0 = Data is being received

bit 3 **PERR:** Parity Error Status bit (read-only)
1 = Parity error has been detected for the current character
0 = Parity error has not been detected

bit 2 **FERR:** Framing Error Status bit (read-only)
1 = Framing error has been detected for the current character
0 = Framing error has not been detected

bit 1 **OERR:** Receive Buffer Overrun Error Status bit.
This bit is set in hardware and can only be cleared (= 0) in software. Clearing a previously set OERR bit resets the receiver buffer and RSR to empty state.
1 = Receive buffer has overflowed
0 = Receive buffer has not overflowed

bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)
1 = Receive buffer has data, at least one more character can be read
0 = Receive buffer is empty

## 23.0 PARALLEL MASTER PORT (PMP)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. "Parallel Master Port (PMP)"** (DS60001128) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

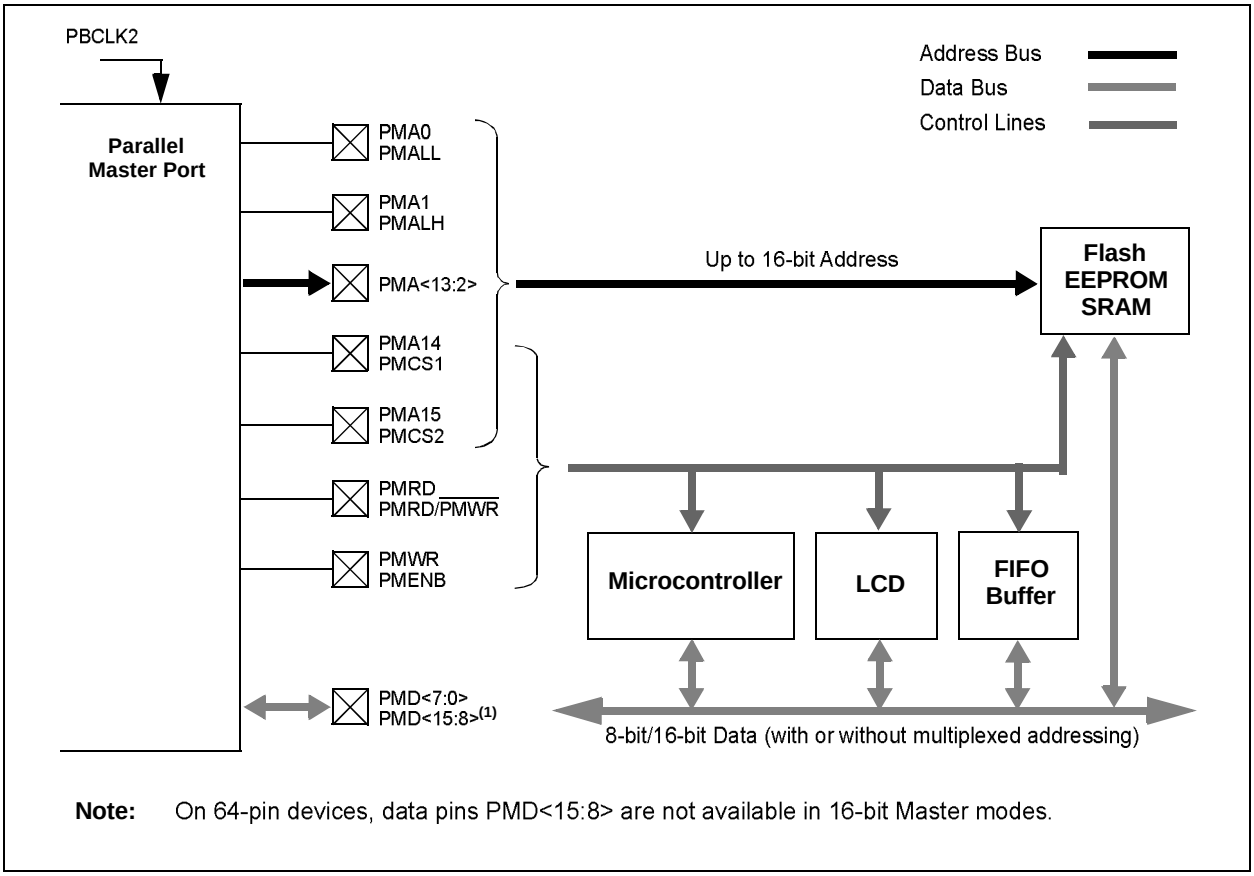

The PMP is a parallel 8-bit/16-bit input/output module specifically designed to communicate with a wide variety of parallel devices, such as communications peripherals, LCDs, external memory devices and microcontrollers. Because the interface to parallel peripherals varies significantly, the PMP module is highly configurable.

The following are key features of the PMP module:

- 8-bit,16-bit interface
- Up to 16 programmable address lines
- Up to two Chip Select lines
- Programmable strobe options:
  - Individual read and write strobes, or
  - Read/write strobe with enable strobe
- Address auto-increment/auto-decrement
- Programmable address/data multiplexing
- Programmable polarity on control signals
- Parallel Slave Port support:
  - Legacy addressable
  - Address support
  - 4-byte deep auto-incrementing buffer
- Programmable Wait states
- Operate during Sleep and Idle modes
- Separate configurable read/write registers or dual buffers for Master mode
- Fast bit manipulation using CLR, SET, and INV registers

**Note:** On 64-pin devices, data pins PMD<15:8> are not available in 16-bit Master modes.

**FIGURE 23-1: PMP MODULE PINOUT AND CONNECTIONS TO EXTERNAL DEVICES**

**Note:** On 64-pin devices, data pins PMD<15:8> are not available in 16-bit Master modes.

bit 31-24 **Unimplemented:** Read as '0'

bit 23 **RDSTART:** Start Read on PMP Bus bit
This bit is cleared by hardware at the end of the read cycle.
1 = Start a read cycle on the PMP bus
0 = No effect

bit 22-18 **Unimplemented:** Read as '0'

bit 17 **DUALBUF:** Dual Read/Write Buffers enable bit
This bit is valid in Master mode only.
1 = PMP uses separate registers for reads and writes (PMRADDR, PMDATAIN, PMWADDR, PMDATAOUT)
0 = PMP uses legacy registers (PMADDR, PMDATA)

bit 16 **Unimplemented:** Read as '0'

bit 15 **ON:** Parallel Master Port Enable bit
1 = PMP is enabled
0 = PMP is disabled, no off-chip access performed

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12-11 **ADRMUX<1:0>:** Address/Data Multiplexing Selection bits
11 = Lower 8 bits of address are multiplexed on PMD<15:0> pins; upper 8 bits are not used
10 = All 16 bits of address are multiplexed on PMD<15:0> pins
01 = Lower 8 bits of address are multiplexed on PMD<7:0> pins, upper bits are on PMA<15:8>
00 = Address and data appear on separate pins

bit 10 **PMPTTL:** PMP Module TTL Input Buffer Select bit
1 = PMP module uses TTL input buffers
0 = PMP module uses Schmitt Trigger input buffer

bit 9 **PTWREN:** Write Enable Strobe Port Enable bit
1 = PMWR/PMENB port is enabled
0 = PMWR/PMENB port is disabled

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **DATAOUT<15:0>:** Port Data Output bits

This register is used for Read operations in the Enhanced Parallel Slave mode and Write operations for Dual Buffer Master mode.

In Dual Buffer Master mode, the DUALBUF bit (PMPCON<17>) = 1, a write to the MSB triggers the transaction on the PMP port. When MODE16 = 1, MSB = DATAOUT<15:8>. When MODE16 = 0, MSB = DATAOUT<7:0>.

**Note:** In Master mode, a read will return the last value written to the register. In Slave mode, a read will return indeterminate results.

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **DATAIN<15:0>:** Port Data Input bits

This register is used for both Parallel Master Port mode and Enhanced Parallel Slave mode.

In Parallel Master mode, a write to the MSB triggers the write transaction on the PMP port. Similarly, a read to the MSB triggers the read transaction on the PMP port.

When MODE16 = 1, MSB = DATAIN<15:8>. When MODE16 = 0, MSB = DATAIN<7:0>.

**Note:** This register is not used in Dual Buffer Master mode (i.e., DUALBUF bit (PMPCON<17>) = 1).

## 24.0 EXTERNAL BUS INTERFACE (EBI)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 47. "External Bus Interface (EBI)"** (DS60001245) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The External Bus Interface (EBI) module provides a high-speed, convenient way to interface external parallel memory devices to the PIC32MZ EF family device.

With the EBI module, it is possible to connect asynchronous SRAM and NOR Flash devices, as well as non-memory devices such as camera sensors and LCDs.

The features of the EBI module depend on the pin count of the PIC32MZ EF device, as shown in Table 24-1.

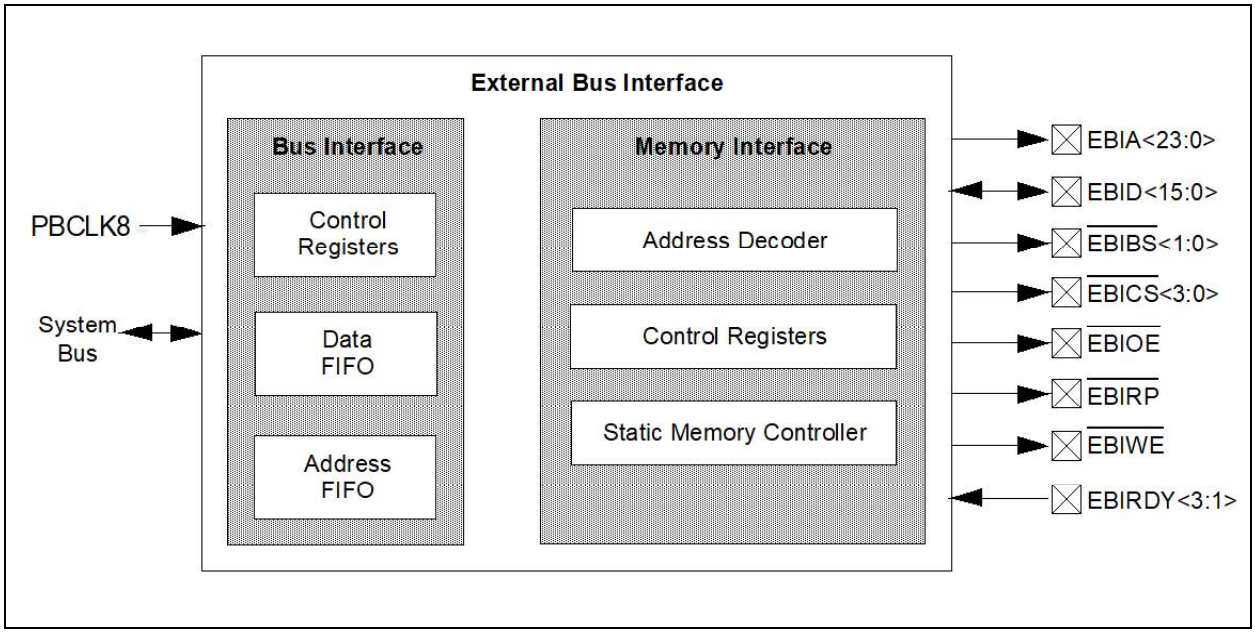

**Note:** The EBI module is not available on 64-pin devices.

**TABLE 24-1: EBI MODULE FEATURES**

| Feature | Number of Device Pins | | |
|---|---|---|---|
| | 100 | 124 | 144 |
| Async SRAM | Y | Y | Y |
| Async NOR Flash | Y | Y | Y |
| Available address lines | 20 | 20 | 24 |
| 8-bit data bus support | Y | Y | Y |
| 16-bit data bus support | Y | Y | Y |
| Available Chip Selects | 1 | 1 | 4 |
| Timing mode sets | 3 | 3 | 3 |
| 8-bit R/W from 16-bit bus | N | N | Y |
| Non-memory device | Y | Y | Y |
| LCD | Y | Y | Y |

**Note:** Once the EBI module is configured, external devices will be memory mapped and can be access from KSEG2 memory space (see Figure 4-1 through Figure 4-4 in **Section 4.0 "Memory Organization"** for more information). The MMU must be enabled and the TLB must be set up to access this memory (refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"* for more information).

## 25.0 REAL-TIME CLOCK AND CALENDAR (RTCC)

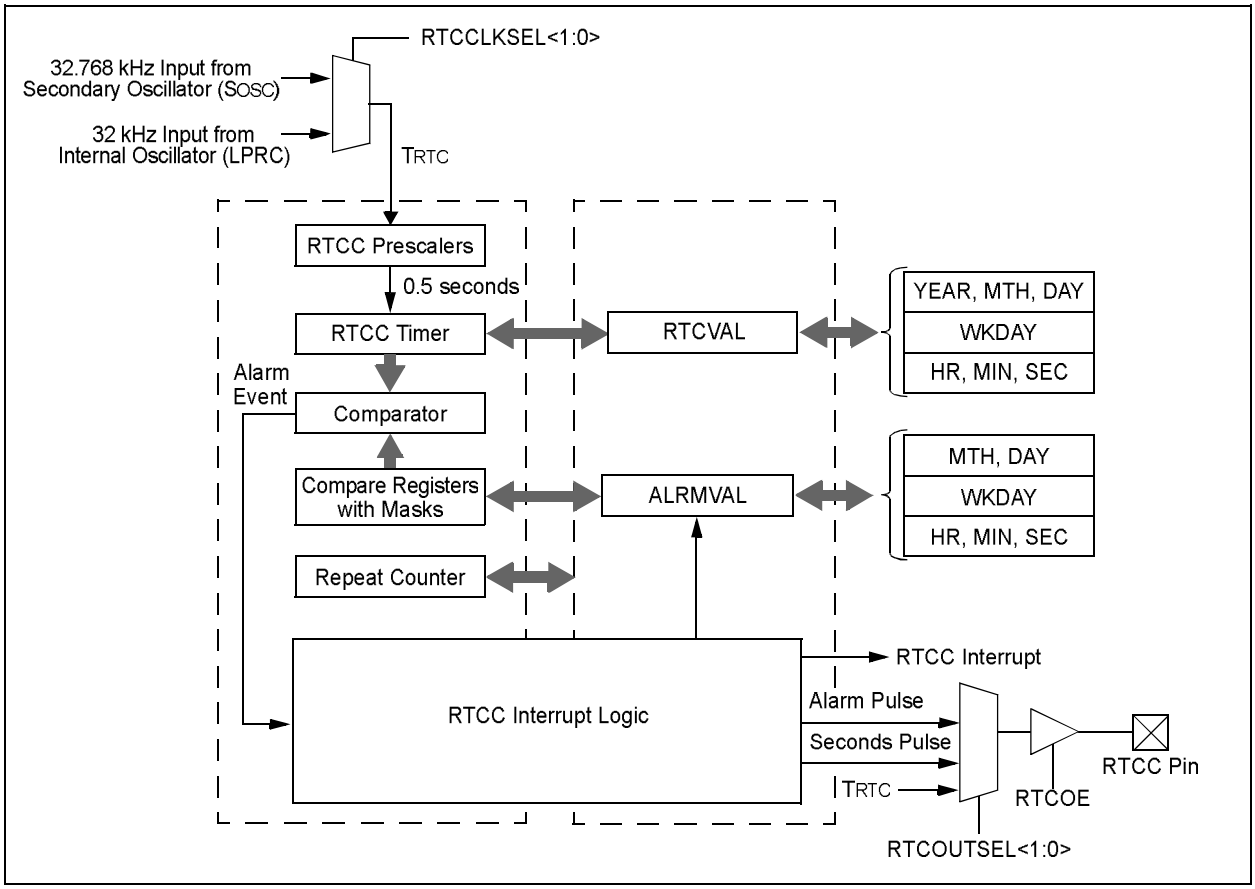

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 29. "Real-Time Clock and Calendar (RTCC)"** (DS60001125) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The RTCC module is intended for applications in which accurate time must be maintained for extended periods of time with minimal or no CPU intervention. Low-power optimization provides extended battery lifetime while keeping track of time.

The following are key features of the RTCC module:

- Time: hours, minutes, and seconds
- 24-hour format (military time)
- Visibility of one-half second period
- Provides calendar: Weekday, date, month and year
- Alarm intervals are configurable for half of a second, one second, 10 seconds, one minute, 10 minutes, one hour, one day, one week, one month, and one year
- Alarm repeat with decrementing counter
- Alarm with indefinite repeat: Chime
- Year range: 2000 to 2099
- Leap year correction
- BCD format for smaller firmware overhead
- Optimized for long-term battery operation
- Fractional second synchronization
- User calibration of the clock crystal frequency with auto-adjust
- Calibration range: ±0.66 seconds error per month
- Calibrates up to 260 ppm of crystal error
- Uses external 32.768 kHz crystal or 32 kHz internal oscillator
- Alarm pulse, seconds clock, or internal clock output on RTCC pin

1 = Disables RTCC operation when CPU enters Idle mode
0 = Continue normal operation when CPU enters Idle mode

bit 12-11 **Unimplemented:** Read as '0'

**Note 1:** The ON bit is only writable when RTCWREN = 1.
**2:** Requires RTCOE = 1 (RTCCON<0>) for the output to be active.
**3:** The RTCWREN bit can be set only when the write sequence is enabled.
**4:** This bit is read-only. It is cleared to '0' on a write to the seconds bit fields (RTCTIME<14:8>).
**5:** This bit is undefined when RTCCLKSEL<1:0> = 00 (LPRC is the clock source).

**Note:** This register is reset only on a Power-on Reset (POR).

**REGISTER 25-1: RTCCON: REAL-TIME CLOCK AND CALENDAR CONTROL REGISTER**

bit 3 **RTCWREN:** Real-Time Clock Value Registers Write Enable bit(3)

1 = Real-Time Clock Value registers can be written to by the user
0 = Real-Time Clock Value registers are locked out from being written to by the user

bit 2 **RTCSYNC:** Real-Time Clock Value Registers Read Synchronization bit

1 = Real-time clock value registers can change while reading (due to a rollover ripple that results in an invalid data read). If the register is read twice and results in the same data, the data can be assumed to be valid.
0 = Real-time clock value registers can be read without concern about a rollover ripple

bit 1 **HALFSEC:** Half-Second Status bit(4)

1 = Second half period of a second
0 = First half period of a second

bit 0 **RTCOE:** RTCC Output Enable bit

1 = RTCC output is enabled

bit 15 **ALRMEN:** Alarm Enable bit(1,2)
- 1 = Alarm is enabled
- 0 = Alarm is disabled

bit 14 **CHIME:** Chime Enable bit(2)
- 1 = Chime is enabled – ARPT<7:0> is allowed to rollover from 0x00 to 0xFF
- 0 = Chime is disabled – ARPT<7:0> stops once it reaches 0x00

bit 13 **PIV:** Alarm Pulse Initial Value bit(2)

When ALRMEN = 0, PIV is writable and determines the initial value of the Alarm Pulse.
When ALRMEN = 1, PIV is read-only and returns the state of the Alarm Pulse.

bit 12 **ALRMSYNC:** Alarm Sync bit
- 1 = ARPT<7:0> and ALRMEN may change as a result of a half second rollover during a read. The ARPT must be read repeatedly until the same value is read twice. This must be done since multiple bits may be changing.
- 0 = ARPT<7:0> and ALRMEN can be read without concerns of rollover because the prescaler is more than 32 real-time clocks away from a half-second rollover

## 26.0 CRYPTO ENGINE

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. "Crypto Engine (CE) and Random Number Generator (RNG)"** (DS60001246) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Crypto Engine is intended to accelerate applications that need cryptographic functions. By executing these functions in the hardware module, software overhead is reduced and actions, such as encryption, decryption, and authentication can execute much more quickly.

The Crypto Engine uses an internal descriptor-based DMA for efficient programming of the security association data and packet pointers (allowing scatter/gather data fetching). An intelligent state machine schedules the Crypto Engines based on the protocol selection and packet boundaries. The hardware engines can perform the encryption and authentication in sequence or in parallel.

The following are key features of the Crypto Engine:

- Bulk ciphers and hash engines
- Integrated DMA to off-load processing:
  - Buffer descriptor-based
  - Secure association per buffer descriptor
- Some functions can execute in parallel

Bulk ciphers that are handled by the Crypto Engine include:

- AES:
  - 128-bit, 192-bit, and 256-bit key sizes
  - CBC, ECB, CTR, CFB, and OFB modes
- DES/TDES:
  - CBC, ECB, CFB, and OFB modes

Authentication engines that are available through the Crypto Engine include:

- SHA-1
- SHA-256
- MD-5
- AES-GCM
- HMAC operation (for all authentication engines)

The rate of data that can be processed by the Crypto Engine depends on these factors:

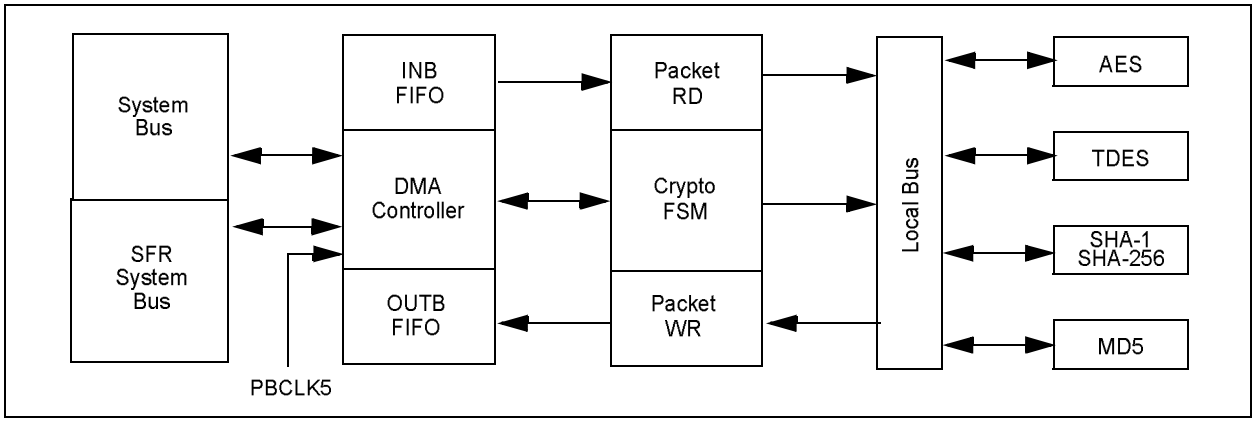

- Which engine is in use
- Whether the engines are used in parallel or in series
- The demands on source and destination memories by other parts of the system (i.e., CPU, DMA, etc.)
- The speed of PBCLK5, which drives the Crypto Engine

Table 26-1 shows typical performance for various engines.

**TABLE 26-1: CRYPTO ENGINE PERFORMANCE**

| Engine/ Algorithm | Performance Factor (Mbps/MHz) | Maximum Mbps (PBCLK5 = 100 MHz) |
|---|---|---|
| DES | 14.4 | 1440 |
| TDES | 6.6 | 660 |
| AES-128 | 9.0 | 900 |
| AES-192 | 7.9 | 790 |
| AES-256 | 7.2 | 720 |
| MD5 | 15.6 | 1560 |
| SHA-1 | 13.2 | 1320 |
| SHA-256 | 9.3 | 930 |

## 26.2 Crypto Engine Buffer Descriptors

Host software creates a linked list of buffer descriptors and the hardware updates them. Table 26-3 provides a list of the Crypto Engine buffer descriptors, followed by format descriptions of each buffer descriptor (see Figure 26-2 through Figure 26-9).

bit 22 **SA_FETCH_EN:** Fetch Security Association From External Memory
1 = Fetch SA from the SA pointer. This bit needs to be set to '1' for every new packet.
0 = Use current fetched SA or the internal SA

bit 21-20 **Unimplemented:** Must be written as '0'

bit 19 **LAST_BD:** Last Buffer Descriptors
1 = Last Buffer Descriptor in the chain
0 = More Buffer Descriptors in the chain
After the last BD, the CEBDADDR goes to the base address in CEBDPADDR.

bit 18 **LIFM:** Last In Frame
In case of Receive Packets (from H/W-> Host), this field is filled by the Hardware to indicate whether the packet goes across multiple buffer descriptors. In case of transmit packets (from Host -> H/W), this field indicates whether this BD is the last in the frame.

bit 17 **PKT_INT_EN:** Packet Interrupt Enable
Generate an interrupt after processing the current buffer descriptor, if it is the end of the packet.

bit 16 **CBD_INT_EN:** CBD Interrupt Enable
Generate an interrupt after processing the current buffer descriptor.

bit 15-0 **BD_BUFLEN<15:0>:** Buffer Descriptor Length
This field contains the length of the buffer and is updated with the actual length filled by the receiver.

## 26.3 Security Association Structure

Table 26-4 shows the Security Association Structure. The Crypto Engine uses the Security Association to determine the settings for processing a Buffer Descriptor Processor. The Security Association contains:

- Which algorithm to use
- Whether to use engines in parallel (for both authentication and encryption/decryption)
- The size of the key
- Authentication key
- Encryption/decryption key
- Authentication Initialization Vector (IV)
- Encryption IV

Figure 26-10 shows the Security Association control word structure.

The Crypto Engine fetches different structures for different flows and ensures that hardware fetches minimum words from SA required for processing. The structure is ready for hardware optimal data fetches.

bit 31-30 **Reserved:** Do not use

bit 29 **VERIFY:** NIST Procedure Verification Setting
1 = NIST procedures are to be used
0 = Do not use NIST procedures

bit 28 **Reserved:** Do not use

bit 27 **NO_RX:** Receive DMA Control Setting
1 = Only calculate ICV for authentication calculations
0 = Normal processing

bit 26 **OR_EN:** OR Register Bits Enable Setting
1 = OR the register bits with the internal value of the CSR register
0 = Normal processing

bit 25 **ICVONLY:** Incomplete Check Value Only Flag
This affects the SHA-1 algorithm only. It has no effect on the AES algorithm.
1 = Only three words of the HMAC result are available
0 = All results from the HMAC result are available

bit 24 **IRFLAG:** Immediate Result of Hash Setting
This bit is set when the immediate result for hashing is requested.
1 = Save the immediate result for hashing
0 = Do not save the immediate result

bit 23 **LNC:** Load New Keys Setting
1 = Load a new set of keys for encryption and authentication
0 = Do not load new keys

bit 22 **LOADIV:** Load IV Setting
1 = Load the IV from this Security Association
0 = Use the next IV

bit 21 **FB:** First Block Setting
This bit indicates that this is the first block of data to feed the IV value.
1 = Indicates this is the first block of data
0 = Indicates this is not the first block of data

bit 20 **FLAGS:** Incoming/Outgoing Flow Setting
1 = Security Association is associated with an outgoing flow
0 = Security Association is associated with an incoming flow

bit 19-17 **Reserved:** Do not use

**Figure 26-10: Format of SA_CTRL (Continued)**

bit 16-10 **ALGO<6:0>:** Type of Algorithm to Use
- 1xxxxxx = HMAC 1
- x1xxxxx = SHA-256
- xx1xxxx = SHA1
- xxx1xxx = MD5
- xxxx1xx = AES
- xxxxx1x = TDES
- xxxxxx1 = DES

bit 9 **ENC:** Type of Encryption Setting
- 1 = Encryption
- 0 = Decryption

bit 8-7 **KEYSIZE<1:0>:** Size of Keys in SA_AUTHKEYx or SA_ENCKEYx
- 11 = Reserved; do not use
- 10 = 256 bits
- 01 = 192 bits
- 00 = 128 bits(1)

bit 6-4 **MULTITASK<2:0>:** How to Combine Parallel Operations in the Crypto Engine
- 111 = Parallel pass (decrypt and authenticate incoming data in parallel)
- 101 = Pipe pass (encrypt the incoming data, and then perform authentication on the encrypted data)
- 011 = Reserved
- 010 = Reserved
- 001 = Reserved
- 000 = Encryption or authentication or decryption (no pass)

bit 3-0 **CRYPTOALGO<3:0>:** Mode of operation for the Crypto Algorithm
- 1111 = Reserved
- 1110 = AES_GCM (for AES processing)
- 1101 = RCTR (for AES processing)
- 1100 = RCBC_MAC (for AES processing)
- 1011 = ROFB (for AES processing)
- 1010 = RCFB (for AES processing)
- 1001 = RCBC (for AES processing)
- 1000 = RECB (for AES processing)
- 0111 = TOFB (for Triple-DES processing)
- 0110 = TCFB (for Triple-DES processing)
- 0101 = TCBC (for Triple-DES processing)
- 0100 = TECB (for Triple-DES processing)
- 0011 = OFB (for DES processing)
- 0010 = CFB (for DES processing)
- 0001 = CBC (for DES processing)
- 0000 = ECB (for DES processing)

**Note 1:** This setting does not alter the size of SA_AUTHKEYx or SA_ENCKEYx in the Security Association, only the number of bits of SA_AUTHKEYx and SA_ENCKEYx that are used.

## 27.0 RANDOM NUMBER GENERATOR (RNG)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 49. "Crypto Engine (CE) and Random Number Generator (RNG)"** (DS60001246) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Random Number Generator (RNG) core implements a thermal noise-based, True Random Number Generator (TRNG) and a cryptographically secure Pseudo-Random Number Generator (PRNG).

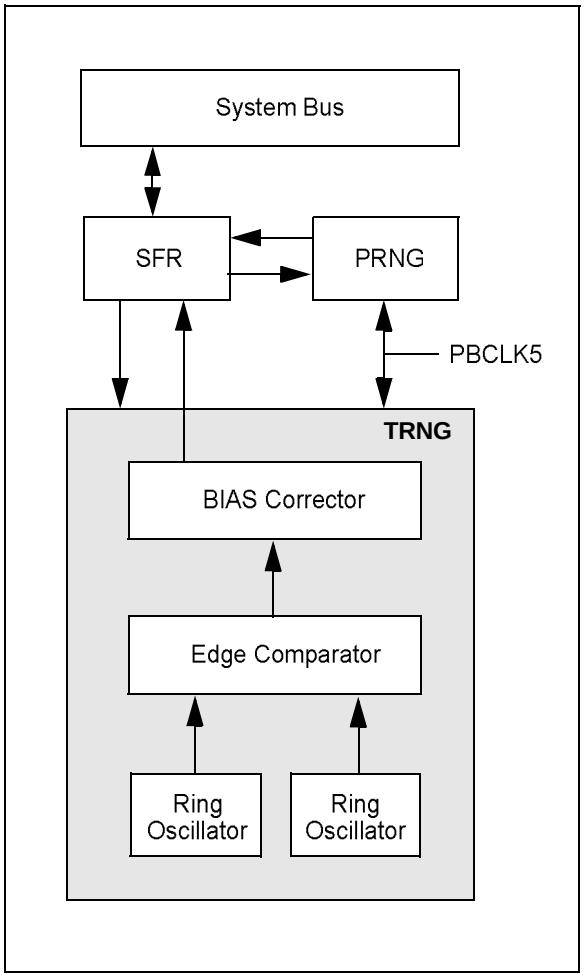

The TRNG uses multiple ring oscillators and the inherent thermal noise of integrated circuits to generate true random numbers that can initialize the PRNG.

The PRNG is a flexible LSFR, which is capable of manifesting a maximal length LFSR of up to 64-bits.

The following are some of the key features of the Random Number Generator:

- TRNG:
  - Up to 25 Mbps of random bits
  - Multi-Ring Oscillator based design
  - Built-in Bias Corrector
- PRNG:
  - LSFR-based
  - Up to 64-bit polynomial length
  - Programmable polynomial
  - TRNG can be seed value

# 28.0 12-BIT HIGH-SPEED SUCCESSIVE APPROXIMATION REGISTER (SAR) ANALOG-TO-DIGITAL CONVERTER (ADC)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 22. "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** (DS60001344) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The 12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC) includes the following key features:

- 12-bit resolution
- Six ADC modules with dedicated Sample and Hold (S&H) circuits
- Two dedicated ADC modules can be combined in Turbo mode to provide double conversion rate (clock sources for combined ADC modules must be synchronous)
- Single-ended and/or differential inputs
- Can operate during Sleep mode
- Supports touch sense applications
- Six digital comparators
- Six digital filters supporting two modes:
  - Oversampling mode
  - Averaging mode
- Early interrupt generation resulting in faster processing of converted data
- Designed for motor control, power conversion, and general purpose applications

A simplified block diagram of the ADC module is illustrated in Figure 28-1.

The 12-bit HS SAR ADC has up to five dedicated ADC modules (ADC0-ADC4) and one shared ADC module (ADC7). The dedicated ADC modules use a single input (or its alternate) and are intended for high-speed and precise sampling of time-sensitive or transient inputs. The the shared ADC module incorporates a multiplexer on the input to facilitate a larger group of inputs, with slower sampling, and provides flexible automated scanning option through the input scan logic.

For each ADC module, the analog inputs are connected to the S&H capacitor. The clock, sampling time, and output data resolution for each ADC module can be set independently. The ADC module performs the conversion of the input analog signal based on the configurations set in the registers. When conversion is complete, the final result is stored in the result buffer for the specific analog input and is passed to the digital filter and digital comparator if configured to use data from this particular sample. Input to ADCx mapping is illustrated in Figure 28-2.

## 28.1 Activation Sequence

**Step 1:** Initialize the ADC calibration values by copying it from the factory programmed DEVADCx Flash locations starting at 0xBFC45000 into the ADCxCFG registers starting at 0xBF887D00. Then, configure the AICPMPEN bit (ADCCON1<12> and the IOANCPEN bit (CFGCON<7>) = 1 if and only if $V_{DD}$ is less than 2.5V. The default is '0', which assumes $V_{DD}$ is greater than or equal to 2.5V.

**Step 2:** Write all the essential ADC configuration SFRs including the ADC control clock and all ADC core clocks setup as given below:

- ADCCON1, keeping the ON bit = 0
- ADCCON2, especially paying attention to ADCDIV<6:0> and SAMC<9:0>
- ADCANCON, keeping all analog enables ANENx bit = 0, WKUPCLKCNT bit = 0xA
- ADCCON3, keeping all DIGEN5x = 0, especially paying attention to ADCSEL<1:0>, CONCLKDIV <5:0>, and VREFSEL<2:0>
- ADCxTIME, ADCDIVx<6:0>, and SAMCx<9:0>
- ADCTRGMODE, ADCIMCONx, ADCTRGSNS, ADCCSSx, ADCGIRQENx, ADCTRGx, ADCBASE
- Comparators, filters, and so on

**Step 3:** Set the ON bit to '1', which enables the ADC control clock.

**Step 4:** Wait for the interrupt or polls the status bit BGVRRDY = 1, which signals that the device analog environment (band gap and $V_{REF}$) is ready.

**Step 5:** Set the ANENx bit to '1' for each of the ADC SAR cores to be used.

**Step 6:** Wait for the interrupt or polls the warm-up ready bits WKRDYx = 1, which signals that the respective ADC SAR cores are ready to operate.

**Step 7:** Set the DIGENx bit to '1', which enables the digital circuitry to immediately begin processing incoming triggers to perform data conversions.

The throughput rate (see Table 37-39 in **37.0 "Electrical Characteristics"**) is calculated, as shown in Equation 28-1.

**EQUATION 28-1: ADC THROUGHPUT RATE**

$$FTP \quad \frac{T_{AD}}{(T_{SAMP} \quad T_{CONV})}$$

Where,

$T_{AD}$ = the frequency of the individual ADC module

**Note 1:** Prior to enabling the ADC module, the user application must copy the ADC calibration data (DEVADC0-DEVADC4, DEVADC7; see Register 34-13) from the Configuration memory into the ADC Configuration registers (ADC0CFG-ADC4CFG, ADC7CFG).

**2:** Configure the AICPMPEN (ADCCON1<12>) and IOANCPEN (CFGCON<7>) bits to '0' if VDD >= 2.5V. Set the AICPMPEN and IOANCPEN bits to '1' if VDD < 2.5V.

**TABLE 28-1: PIC32MZXXEFXX INTERLEAVED ADC THROUGHPUT RATES**

| #No. of Interleaved ADC Possible | ADC TAD (min) = 20 ns (50 Mhz max.) | | | |
|---|---|---|---|---|
| | 12-bit (max.) msps | 10-bit (max.) msps | 8-bit (max.) msps | 6-bit (max.) msps |
| 1 | 3.125 msps | 3.571 msps | 4.167 msps | 5.0 msps |
| 2 | 6.250 msps | 7.143 msps | 8.333 msps | 10.00 msps |
| 3 | 8.330 msps | 10.00 msps | 12.50 msps | 12.50 msps |
| 4 | 12.50 msps | 12.50 msps | 16.667 msps | 16.667 msps |

**Note:** Interleaved ADCs in this context means connecting the same analog source signal to multiple dedicated Class_1 ADCs (i.e., ADC0-ADC5), and using independent staggered trigger sources accordingly for each interleaved ADC.

**Note 1:** This bit or register is not available on 64-pin devices.
**2:** This bit or register is not available on 64-pin and 100-pin devices.
**3:** Before enabling the ADC, the user application must initialize the ADC calibration values by copying them from the factory-programmed DEVADCx Flash registers into the corresponding ADCxCFG registers.

bit 31 **TRBEN:** Turbo Channel Enable bit
1 = Enable the Turbo channel
0 = Disable the Turbo channel

bit 30 **TRBERR:** Turbo Channel Error Status bit
1 = An error occurred while setting the Turbo channel and Turbo channel function to be disabled regardless of the TRBEN bit being set to '1'.
0 = Turbo channel error did not occur

**Note:** The status of this bit is valid only after the TRBEN bit is set.

bit 23 **FRACT:** Fractional Data Output Format bit
1 = Fractional
0 = Integer

bit 22-21 **SELRES<1:0>:** Shared ADC (ADC7) Resolution bits
11 = 12 bits (default)
10 = 10 bits
01 = 8 bits
00 = 6 bits

**Note:** Changing the resolution of the ADC does not shift the result in the corresponding ADCDATAx register. The result will still occupy 12 bits, with the corresponding lower unused bits set to '0'. For example, a resolution of 6 bits will result in ADCDATAx<5:0> being set to '0', and ADCDATAx<11:6> holding the result.

1 = ADC module is enabled
0 = ADC module is disabled

**Note:** The ON bit should be set only after the ADC module has been configured.

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Stop in Idle Mode bit
1 = Discontinue module operation when device enters Idle mode
0 = Continue module operation in Idle mode

bit 12 **AICPMPEN:** Analog Input Charge Pump Enable bit
1 = Analog input charge pump is enabled (default)
0 = Analog input charge pump is disabled

**Note 1:** For proper analog operation at VVDIO less than 2.5V, the AICPMPEN bit and the IOANCPEN (CFGCON<7>) bit must be set to '1.' , and these bits should not be set if VDDIO is greater than 2.5V.

**2:** ADC throughput rate performance is reduced as defined in the table below if the AICPMPEN (ADCCON1<12>) bit and the IOANCPEN(CFGCON<7>) bit are set to '1'.

0 = Fast synchronous peripheral clock to ADC control clock is disabled

bit 8-7 **Unimplemented:** Read as '0'

bit 6-4 **IRQVS<2:0>:** Interrupt Vector Shift bits
To determine interrupt vector address, this bit specifies the amount of left shift done to the ARDYx status bits in the ADCDSTAT1 and ADCDSTAT2 registers, prior to adding with the ADCBASE register.

Interrupt Vector Address = Read Value of ADCBASE and Read Value of ADCBASE = Value written to ADCBASE + x << IRQVS<2:0>, where 'x' is the smallest active input ID from the ADCDSTAT1 or ADCDSTAT2 registers (which has highest priority).

111 = Shift x left 7 bit position
110 = Shift x left 6 bit position
101 = Shift x left 5 bit position
100 = Shift x left 4 bit position
011 = Shift x left 3 bit position
010 = Shift x left 2 bit position
001 = Shift x left 1 bit position
000 = Shift x left 0 bit position

bit 3 **STRGLVL:** Scan Trigger High Level/Positive Edge Sensitivity bit
1 = Scan trigger is high level sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), the scan trigger will continue for all selected analog inputs, until the STRIG option is removed.
0 = Scan trigger is positive edge sensitive. Once STRIG mode is selected (TRGSRCx<4:0> in the ADCTRGx register), only a single scan trigger will be generated, which will complete the scan of all selected analog inputs.

bit 31 **BGVRRDY:** Band Gap Voltage/ADC Reference Voltage Status bit
1 = Both band gap voltage and ADC reference voltages (VREF) are ready
0 = Either or both band gap voltage and ADC reference voltages (VREF) are not ready
Data processing is valid only after BGVRRDY is set by hardware, so the application code must check that the BGVRRDY bit is set to ensure data validity. This bit set to '0' when ON (ADCCON1<15>) = 0.

bit 30 **REFFLT:** Band Gap/VREF/AVDD BOR Fault Status bit
1 = Fault in band gap or the VREF voltage while the ON bit (ADCCON1<15>) was set. Most likely a band gap or VREF fault will be caused by a BOR of the analog VDD supply.
0 = Band gap and VREF voltage are working properly
This bit is cleared when the ON bit (ADCCON1<15>) = 0 and the BGVRRDY bit = 1.

bit 29 **EOSRDY:** End of Scan Interrupt Status bit
1 = All analog inputs are considered for scanning through the scan trigger (all analog inputs specified in the ADCCSS1 and ADCCSS2 registers) have completed scanning
0 = Scanning has not completed
This bit is cleared when ADCCON2<31:24> are read in software.

bit 28-26 **CVDCPL<2:0>:** Capacitor Voltage Divider (CVD) Setting bit
111 = 7 * 2.5 pF = 17.5 pF
110 = 6 * 2.5 pF = 15 pF

1 = Early interrupt generation is not overridden and interrupt generation is controlled by the ADCEIEN1 and ADCEIEN2 registers
0 = Early interrupt generation is overridden and interrupt generation is controlled by the ADCGIRQEN1 and ADCGIRQEN2 registers

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **ADCEIS<2:0>:** Shared ADC (ADC7) Early Interrupt Select bits
These bits select the number of clocks (TAD7) prior to the arrival of valid data that the associated interrupt is generated.
111 = The data ready interrupt is generated 8 ADC clocks prior to end of conversion
110 = The data ready interrupt is generated 7 ADC clocks prior to end of conversion
•
•
•
001 = The data ready interrupt is generated 2 ADC module clocks prior to end of conversion
000 = The data ready interrupt is generated 1 ADC module clock prior to end of conversion

**Note:** All options are available when the selected resolution, set by the SELRES<1:0> bits (ADCCON1<22:21>), is 12-bit or 10-bit. For a selected resolution of 8-bit, options from '000' to '101' are valid. For a selected resolution of 6-bit, options from '000' to '011' are valid.

1 = The ADC S&H amplifier is sampling
0 = The ADC S&H amplifier is holding

bit 8 **RQCNVRT:** Individual ADC Input Conversion Request bit
This bit and its associated ADINSEL<5:0> bits enable the user to individually request an analog-to-digital conversion of an analog input through software.
1 = Trigger the conversion of the selected ADC input as specified by the ADINSEL<5:0> bits
0 = Do not trigger the conversion

**Note:** This bit is automatically cleared in the next ADC clock cycle.

**4:** Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

**REGISTER 28-3: ADCCON3: ADC CONTROL REGISTER 3 (CONTINUED)**

bit 6 **GSWTRG:** Global Software Trigger bit

1 = Trigger conversion for ADC inputs that have selected the GSWTRG bit as the trigger signal, either through the associated TRGSRC<4:0> bits in the ADCTRGx registers or through the STRGSRC<4:0> bits in the ADCCON1 register

0 = Do not trigger an analog-to-digital conversion

**Note:** This bit is automatically cleared in the next ADC clock cycle.

bit 5-0 **ADINSEL<5:0>:** Analog Input Select bits

These bits select the analog input to be converted when the RQCNVRT bit is set. As a general rule:

111111 = Reserved
•
•
•
101101 = Reserved
101100 = MAX_AN_INPUT + 2 = $IV_{TEMP}$
101011 = MAX_AN_INPUT + 1 = $IV_{REF}$
101010 = MAX_AN_INPUT = AN[MAX_AN_INPUT]
•
•
•
000001 = AN1
000000 = AN0

**Note 1:** The SAMP bit has the highest priority and setting this bit will keep the S&H circuit in Sample mode until the bit is cleared. Also, usage of the SAMP bit will cause settings of SAMC<9:0> bits (ADCCON2<25:16>) to be ignored.

**2:** The SAMP bit only connects Class 2 and Class 3 analog inputs to the shared ADC, ADC7. All Class 1 analog inputs are not affected by the SAMP bit.

**3:** The SAMP bit is not a self-clearing bit and it is the responsibility of application software to first clear this bit and only after setting the RQCNVRT bit to start the analog-to-digital conversion.

**4:** Normally, when the SAMP and RQCNVRT bits are used by software routines, all TRGSRCx<4:0> bits and STRGSRC<4:0> bits should be set to '00000' to disable all external hardware triggers and prevent them from interfering with the software-controlled sampling command signal SAMP and with the software-controlled trigger RQCNVRT.

**2:** In addition to setting the appropriate bits in this register, Class 1 and Class 2 analog inputs must select the STRIG input as the trigger source if they are to be scanned through the CSS*x* bits. Refer to the bit descriptions in the ADCTRGx registers for selecting the STRIG option.

**3:** If a Class 1 or Class 2 input is included in the scan by setting the CSSx bit to '1' and by setting the TRGSRCx<4:0> bits to STRIG mode ('0b11), the user application must ensure that no other triggers are generated for that input using the RQCNVRT bit in the ADCCON3 register or the hardware input or any digital filter. Otherwise, the scan behavior is unpredictable.

bit 31-16 **CVDDATA<15:0>:** CVD Data Status bits
In CVD mode, these bits obtain the CVD differential output data (subtraction of CVD positive and negative measurement), whenever a Digital Comparator interrupt is generated. The value in these bits is compliant with the FRACT bit (ADCCON1<23>) and is always signed.

bit 15-14 **Unimplemented:** Read as '0'

bit 13-8 **AINID<5:0>:** Digital Comparator 0 Analog Input Identification (ID) bits
When a digital comparator event occurs (DCMPED = 1), these bits identify the analog input being monitored by Digital Comparator 0.

**Note:** In normal ADC mode, only analog inputs <31:0> can be processed by the Digital Comparator 0. The Digital Comparator 0 also supports the CVD mode, in which all Class 2 and Class 3 analog inputs may be stored in the AINID<5:0> bits.

bit 15-0 **ADCBASE<15:0>:** ADC ISR Base Address bits

This register, when read, contains the base address of the user's ADC ISR jump table. The interrupt vector address is determined by the IRQVS<2:0> bits of the ADCCON1 register specifying the amount of left shift done to the ARDYx status bits in the ADCDSTAT1 and ADCDSTAT2 registers, prior to adding with ADCBASE register.

Interrupt Vector Address = Read Value of ADCBASE and Read Value of ADCBASE = Value written to ADCBASE + x << IRQVS<2:0>, where 'x' is the smallest active analog input ID from the ADCDSTAT1 or ADCDSTAT2 registers (which has highest priority).

bit 31-0 **AN<31:0>:** ADC Analog Input bits

These bits reflect the system configuration and are updated during boot-up time. By reading these read-only bits, the user application can determine whether or not an analog input in the device is available.

AN<31:0>: Reflects the presence or absence of the respective analog input (AN31-AN0).

## 29.0 CONTROLLER AREA NETWORK (CAN)

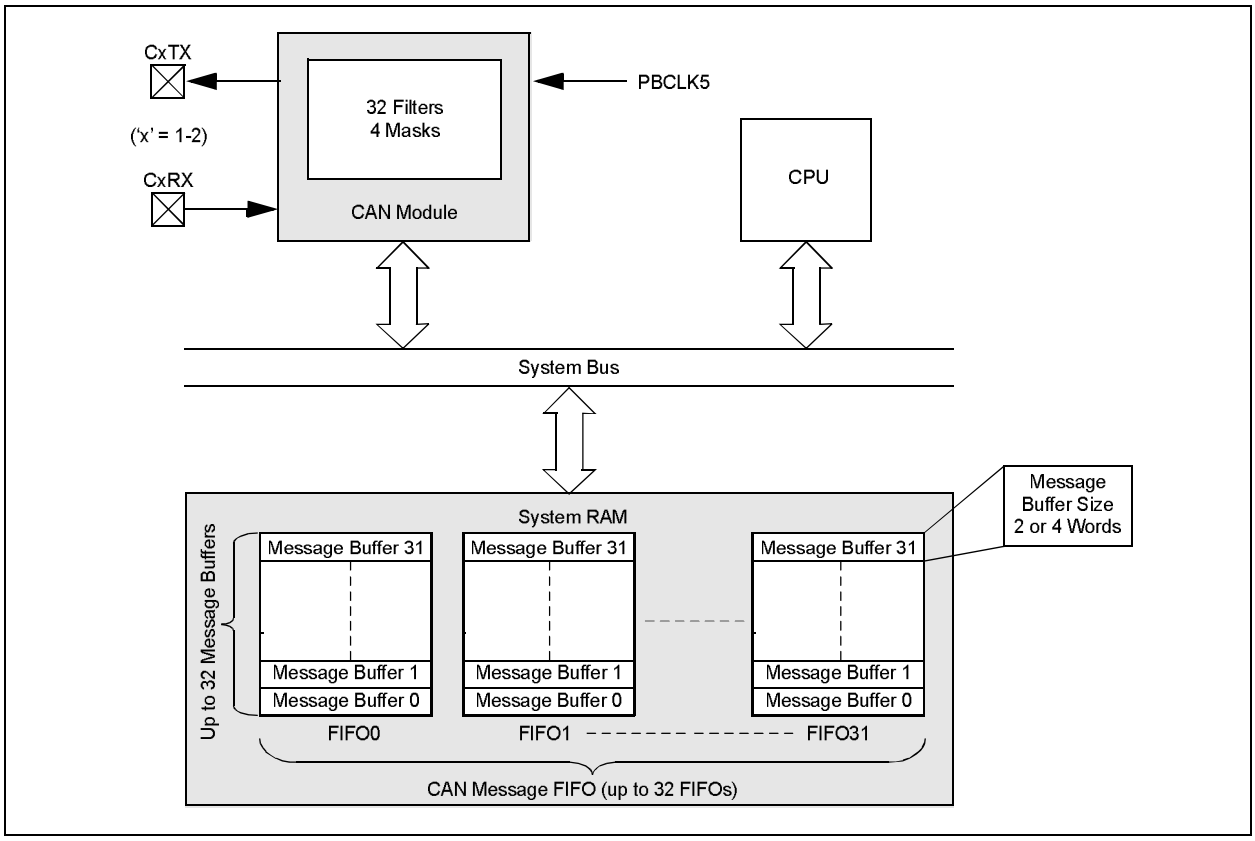

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 34. "Controller Area Network (CAN)"** (DS60001154) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Controller Area Network (CAN) module supports the following key features:

- Standards Compliance:
  - Full CAN 2.0B compliance
  - Programmable bit rate up to 1 Mbps
- Message Reception and Transmission:
  - 32 message FIFOs
  - Each FIFO can have up to 32 messages for a total of 1024 messages
  - FIFO can be a transmit message FIFO or a receive message FIFO
  - User-defined priority levels for message FIFOs used for transmission
  - 32 acceptance filters for message filtering
  - Four acceptance filter mask registers for message filtering
  - Automatic response to remote transmit request
  - DeviceNet™ addressing support
- Additional Features:
  - Loopback, Listen All Messages and Listen Only modes for self-test, system diagnostics and bus monitoring
  - Low-power operating modes
  - CAN module is a bus master on the PIC32 System Bus
  - Use of DMA is not required
  - Dedicated time-stamp timer
  - Dedicated DMA channels
  - Data-only Message Reception mode

Figure 29-1 illustrates the general structure of the CAN module.

bit 31-0 **CiFIFOBA<31:0>:** CAN FIFO Base Address bits
These bits define the base address of all message buffers. Individual message buffers are located based on the size of the previous message buffers. This address is a physical address. Note that bits <1:0> are read-only and read '0', forcing the messages to be 32-bit word-aligned in device RAM.

**Note 1:** This bit is unimplemented and will always read '0', which forces word-alignment of messages.

**Note:** This register can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> (CiCON<23:21>) = 100).

- 1 = FIFO will be reset when bit is set, cleared by hardware when FIFO is reset. After setting, the user application should poll whether this bit is clear before taking any action
- 0 = No effect

bit 13 **UINC:** Increment Head/Tail bit

TXEN = 1: (FIFO configured as a Transmit FIFO)
When this bit is set, the FIFO head will increment by a single message

TXEN = 0: (FIFO configured as a Receive FIFO)
When this bit is set, the FIFO tail will increment by a single message

bit 12 **DONLY:** Store Message Data Only bit(1)

TXEN = 1: (FIFO configured as a Transmit FIFO)
This bit is not used and has no effect.

TXEN = 0: (FIFO configured as a Receive FIFO)
- 1 = Only data bytes will be stored in the FIFO
- 0 = Full message is stored, including identifier

bit 11-8 **Unimplemented:** Read as '0'

bit 7 **TXEN:** TX/RX Buffer Selection bit
- 1 = FIFO is a Transmit FIFO
- 0 = FIFO is a Receive FIFO

**Note 1:** These bits can only be modified when the CAN module is in Configuration mode (OPMOD<2:0> bits (CiCON<23:21>) = 100).

**2:** This bit is updated when a message completes (or aborts) or when the FIFO is reset.

**3:** This bit is reset on any read of this register or when the FIFO is reset.

1 = A bus error occurred while the message was being sent
0 = A bus error did not occur while the message was being sent

bit 3 **TXREQ:** Message Send Request
TXEN = 1: (FIFO configured as a Transmit FIFO)
Setting this bit to '1' requests sending a message.
The bit will automatically clear when all the messages queued in the FIFO are successfully sent.
Clearing the bit to '0' while set ('1') will request a message abort.
TXEN = 0: (FIFO configured as a Receive FIFO)
This bit has no effect.

## 30.0 ETHERNET CONTROLLER

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 35. "Ethernet Controller"** (DS60001155) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The Ethernet controller is a bus master module that interfaces with an off-chip Physical Layer (PHY) to implement a complete Ethernet node in a system.

Key features of the Ethernet Controller include:

- Supports 10/100 Mbps data transfer rates
- Supports full-duplex and half-duplex operation
- Supports RMII and MII PHY interface
- Supports MIIM PHY management interface
- Supports both manual and automatic Flow Control
- RAM descriptor-based DMA operation for both receive and transmit path
- Fully configurable interrupts
- Configurable receive packet filtering
  - CRC check
  - 64-byte pattern match
  - Broadcast, multicast and unicast packets
  - Magic Packet™
  - 64-bit hash table
  - Runt packet
- Supports packet payload checksum calculation
- Supports various hardware statistics counters

Figure 30-1 illustrates a block diagram of the Ethernet controller.

**FIGURE 30-1: ETHERNET CONTROLLER BLOCK DIAGRAM**

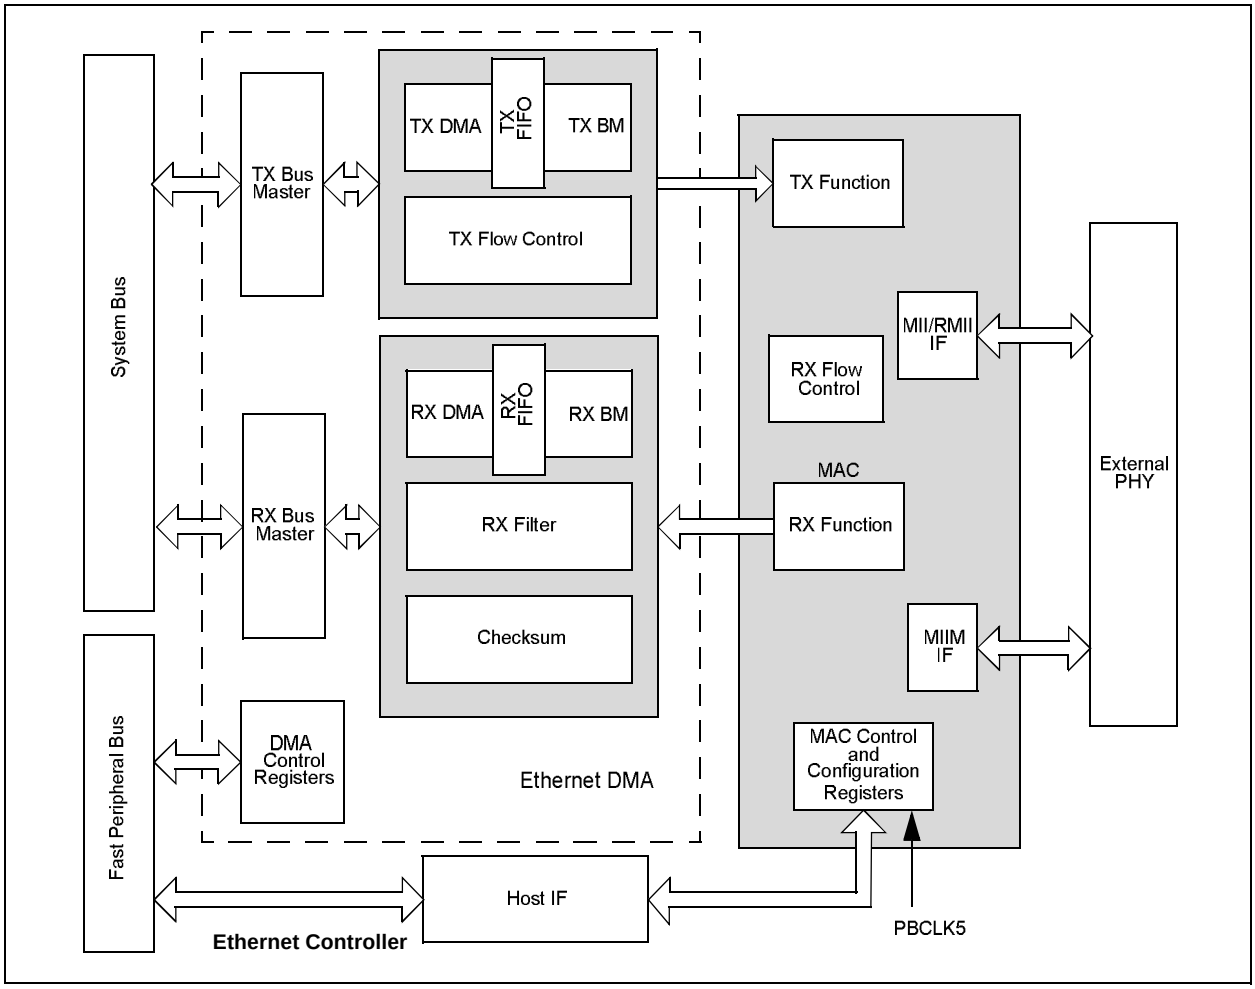

Table 30-1, Table 30-2, Table 30-3 and Table 30-4 show four interfaces and the associated pins that can be used with the Ethernet Controller.

| R = Readable bit | W = Writable bit | U = Unimplemented bit, read as '0' | |
| -n = Value at POR | '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

bit 31-16 **PTV<15:0>:** PAUSE Timer Value bits

PAUSE Timer Value used for Flow Control.
This register should only be written when RXEN (ETHCON1<8>) is not set.

These bits are only used for Flow Control operations.

bit 15 **ON:** Ethernet ON bit

1 = Ethernet module is enabled
0 = Ethernet module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **SIDL:** Ethernet Stop in Idle Mode bit

1 = Ethernet module transfers are paused during Idle mode
0 = Ethernet module transfers continue during Idle mode

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **TXRTS:** Transmit Request to Send bit

1 = Activate the TX logic and send the packet(s) defined in the TX EDT
0 = Stop transmit (when cleared by software) or transmit done (when cleared by hardware)

After the bit is written with a '1', it will clear to a '0' whenever the transmit logic has finished transmitting the requested packets in the Ethernet Descriptor Table (EDT). If a '0' is written by the CPU, the transmit logic finishes the current packet's transmission and then stops any further.

This bit only affects TX operations.

bit 8 **RXEN:** Receive Enable bit(1)

1 = Enable RX logic, packets are received and stored in the RX buffer as controlled by the filter configuration
0 = Disable RX logic, no packets are received in the RX buffer

This bit only affects RX operations.

**Note 1:** It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

**REGISTER 30-1: ETHCON1: ETHERNET CONTROLLER CONTROL REGISTER 1 (CONTINUED)**

bit 7 **AUTOFC:** Automatic Flow Control bit

1 = Automatic Flow Control enabled
0 = Automatic Flow Control disabled

Setting this bit will enable automatic Flow Control. If set, the full and empty watermarks are used to automatically enable and disable the Flow Control, respectively. When the number of received buffers BUFCNT (ETHSTAT<16:23>) rises to the full watermark, Flow Control is automatically enabled. When the BUFCNT falls to the empty watermark, Flow Control is automatically disabled.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 6-5 **Unimplemented:** Read as '0'

bit 4 **MANFC:** Manual Flow Control bit

1 = Manual Flow Control is enabled
0 = Manual Flow Control is disabled

Setting this bit will enable manual Flow Control. If set, the Flow Control logic will send a PAUSE frame using the PAUSE timer value in the PTV register. It will then resend a PAUSE frame every 128 * PTV<15:0>/2 TX clock cycles until the bit is cleared.

**Note:** For 10 Mbps operation, TX clock runs at 2.5 MHz. For 100 Mbps operation, TX clock runs at 25 MHz.

When this bit is cleared, the Flow Control logic will automatically send a PAUSE frame with a 0x0000 PAUSE timer value to disable Flow Control.

This bit is only used for Flow Control operations and affects both TX and RX operations.

bit 3-1 **Unimplemented:** Read as '0'

bit 0 **BUFCDEC:** Descriptor Buffer Count Decrement bit

The BUFCDEC bit is a write-1 bit that reads as '0'. When written with a '1', the Descriptor Buffer Counter, BUFCNT, will decrement by one. If BUFCNT is incremented by the RX logic at the same time that this bit is written, the BUFCNT value will remain unchanged. Writing a '0' will have no effect.

This bit is only used for RX operations.

**Note 1:** It is not recommended to clear the RXEN bit and then make changes to any RX related field/register. The Ethernet Controller must be reinitialized (ON cleared to '0'), and then the RX changes applied.

bit 7 **CRCERREN:** CRC Error Collection Enable bit
1 = The received packet CRC must be invalid for the packet to be accepted
0 = Disable CRC Error Collection filtering
This bit allows the user to collect all packets that have an invalid CRC.

bit 6 **CRCOKEN:** CRC OK Enable bit
1 = The received packet CRC must be valid for the packet to be accepted
0 = Disable CRC filtering
This bit allows the user to reject all packets that have an invalid CRC.

bit 5 **RUNTERREN:** Runt Error Collection Enable bit
1 = The received packet must be a runt packet for the packet to be accepted
0 = Disable Runt Error Collection filtering
This bit allows the user to collect all packets that are runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes (when CRCOKEN = 0) or any packet with a size of less than 64 bytes that has a valid CRC (when CRCOKEN = 1).

bit 4 **RUNTEN:** Runt Enable bit
1 = The received packet must not be a runt packet for the packet to be accepted
0 = Disable Runt filtering
This bit allows the user to reject all runt packets. For this filter, a runt packet is defined as any packet with a size of less than 64 bytes.

bit 3 **UCEN:** Unicast Enable bit
1 = Enable Unicast Filtering
0 = Disable Unicast Filtering
This bit allows the user to accept all unicast packets whose Destination Address matches the Station Address.

bit 2 **NOTMEEN:** Not Me Unicast Enable bit
1 = Enable Not Me Unicast Filtering
0 = Disable Not Me Unicast Filtering
This bit allows the user to accept all unicast packets whose Destination Address does not match the Station Address.

bit 1 **MCEN:** Multicast Enable bit
1 = Enable Multicast Filtering
0 = Disable Multicast Filtering
This bit allows the user to accept all Multicast Address packets.

bit 0 **BCEN:** Broadcast Enable bit
1 = Enable Broadcast Filtering
0 = Disable Broadcast Filtering
This bit allows the user to accept all Broadcast Address packets.

**Note 1:** XOR = True when either one or the other conditions are true, but not both.

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **TXBUSE:** Transmit BVCI Bus Error Interrupt bit(2)
1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred
This bit is set when the TX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 13 **RXBUSE:** Receive BVCI Bus Error Interrupt bit(2)
1 = BVCI Bus Error has occurred
0 = BVCI Bus Error has not occurred
This bit is set when the RX DMA encounters a BVCI Bus error during a memory access. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 12-10 **Unimplemented:** Read as '0'

bit 9 **EWMARK:** Empty Watermark Interrupt bit(2)
1 = Empty Watermark pointer reached
0 = No interrupt pending
This bit is set when the RX Descriptor Buffer Count is less than or equal to the value in the RXEWM bit (ETHRXWM<0:7>) value. It is cleared by BUFCNT bit (ETHSTAT<16:23>) being incremented by hardware. Writing a '0' or a '1' has no effect.

bit 8 **FWMARK:** Full Watermark Interrupt bit(2)
1 = Full Watermark pointer reached
0 = No interrupt pending
This bit is set when the RX Descriptor Buffer Count is greater than or equal to the value in the RXFWM bit (ETHRXWM<16:23>) field. It is cleared by writing the BUFCDEC (ETHCON1<0>) bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect.

**Note 1:** This bit is only used for TX operations.
**2:** This bit is are only used for RX operations.

**Note:** It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes.

**REGISTER 30-14: ETHIRQ: ETHERNET CONTROLLER INTERRUPT REQUEST REGISTER**

bit 7 **RXDONE:** Receive Done Interrupt bit(2)
1 = RX packet was successfully received
0 = No interrupt pending
This bit is set whenever an RX packet is successfully received. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 6 **PKTPEND:** Packet Pending Interrupt bit(2)
1 = RX packet pending in memory
0 = RX packet is not pending in memory
This bit is set when the BUFCNT counter has a value other than '0'. It is cleared by either a Reset or by writing the BUFCDEC bit to decrement the BUFCNT counter. Writing a '0' or a '1' has no effect.

bit 5 **RXACT:** Receive Activity Interrupt bit(2)
1 = RX packet data was successfully received
0 = No interrupt pending
This bit is set whenever RX packet data is stored in the RXBM FIFO. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 4 **Unimplemented:** Read as '0'

bit 3 **TXDONE:** Transmit Done Interrupt bit(2)
1 = TX packet was successfully sent
0 = No interrupt pending
This bit is set when the currently transmitted TX packet completes transmission, and the Transmit Status Vector is loaded into the first descriptor used for the packet. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 2 **TXABORT:** Transmit Abort Condition Interrupt bit(2)
1 = TX abort condition occurred on the last TX packet
0 = No interrupt pending
This bit is set when the MAC aborts the transmission of a TX packet for one of the following reasons:
- Jumbo TX packet abort
- Underrun abort
- Excessive defer abort
- Late collision abort
- Excessive collisions abort

This bit is cleared by either a Reset or CPU write of a '1' to the CLR register.

bit 1 **RXBUFNA:** Receive Buffer Not Available Interrupt bit(2)
1 = RX Buffer Descriptor Not Available condition has occurred
0 = No interrupt pending
This bit is set by a RX Buffer Descriptor Overrun condition. It is cleared by either a Reset or a CPU write of a '1' to the CLR register.

bit 0 **RXOVFLW:** Receive FIFO Over Flow Error bit(2)
1 = RX FIFO Overflow Error condition has occurred
0 = No interrupt pending
RXOVFLW is set by the RXBM Logic for an RX FIFO Overflow condition. It is cleared by either a Reset or CPU write of a '1' to the CLR register.

**Note 1:** This bit is only used for TX operations.
**2:** This bit is are only used for RX operations.

| **Note:** | It is recommended to use the SET, CLR, or INV registers to set or clear any bit in this register. Setting or clearing any bits in this register should only be done for debug/test purposes. |

bit 31-24 **Unimplemented:** Read as '0'

bit 23-16 **BUFCNT<7:0>:** Packet Buffer Count bits(1)

Number of packet buffers received in memory. Once a packet has been successfully received, this register is incremented by hardware based on the number of descriptors used by the packet. Software decrements the counter (by writing to the BUFCDEC bit (ETHCON1<0>) for each descriptor used) after a packet has been read out of the buffer. The register does not roll over (0xFF to 0x00) when hardware tries to increment the register and the register is already at 0xFF. Conversely, the register does not roll under (0x00 to 0xFF) when software tries to decrement the register and the register is already at 0x0000. When software attempts to decrement the counter at the same time that the hardware attempts to increment the counter, the counter value will remain unchanged.

When this register value reaches 0xFF, the RX logic will halt (only if automatic Flow Control is enabled) awaiting software to write the BUFCDEC bit in order to decrement the register below 0xFF.

If automatic Flow Control is disabled, the RXDMA will continue processing and the BUFCNT will saturate at a value of 0xFF.

When this register is non-zero, the PKTPEND status bit will be set and an interrupt may be generated, depending on the value of the ETHIEN bit <PKTPENDIE> register.

When the ETHRXST register is written, the BUFCNT counter is automatically cleared to 0x00.

**Note:** BUFCNT will not be cleared when ON is set to '0'. This enables software to continue to utilize and decrement this count.

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **ETHBUSY:** Ethernet Module busy bit(5)

1 = Ethernet logic has been turned on (ON (ETHCON1<15>) = 1) or is completing a transaction
0 = Ethernet logic is idle

This bit indicates that the module has been turned on or is completing a transaction after being turned off.

**Note 1:** This bit is only used for RX operations.
**2:** This bit is only affected by TX operations.
**3:** This bit is only affected by RX operations.
**4:** This bit is affected by TX and RX operations.
**5:** This bit will be *set* when the ON bit (ETHCON1<15>) = 1.
**6:** This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

**REGISTER 30-15: ETHSTAT: ETHERNET CONTROLLER STATUS REGISTER (CONTINUED)**

bit 6 **TXBUSY:** Transmit Busy bit(2,6)

1 = TX logic is receiving data
0 = TX logic is idle

This bit indicates that a packet is currently being transmitted. A change in this status bit is not necessarily reflected by the TXDONE interrupt, as TX packets may be aborted or rejected by the MAC.

bit 5 **RXBUSY:** Receive Busy bit(3,6)

1 = RX logic is receiving data
0 = RX logic is idle

This bit indicates that a packet is currently being received. A change in this status bit is not necessarily reflected by the RXDONE interrupt, as RX packets may be aborted or rejected by the RX filter.

bit 4-0 **Unimplemented:** Read as '0'

**Note 1:** This bit is only used for RX operations.
**2:** This bit is only affected by TX operations.
**3:** This bit is only affected by RX operations.
**4:** This bit is affected by TX and RX operations.
**5:** This bit will be *set* when the ON bit (ETHCON1<15>) = 1.
**6:** This bit will be *cleared* when the ON bit (ETHCON1<15>) = 0.

0 = PAUSE Flow Control frames are blocked

bit 2 **RXPAUSE:** MAC RX Flow Control bit
1 = The MAC acts upon received PAUSE Flow Control frames
0 = Received PAUSE Flow Control frames are ignored

bit 1 **PASSALL:** MAC Pass all Receive Frames bit
1 = The MAC will accept all frames regardless of type (Normal vs. Control)
0 = The received Control frames are ignored

bit 0 **RXENABLE:** MAC Receive Enable bit
1 = Enable the MAC receiving of frames
0 = Disable the MAC receiving of frames

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-15 **Unimplemented:** Read as '0'

bit 14 **EXCESSDER:** Excess Defer bit
1 = The MAC will defer to carrier indefinitely as per the Standard
0 = The MAC will abort when the excessive deferral limit is reached

bit 13 **BPNOBKOFF:** Backpressure/No Backoff bit
1 = The MAC after incidentally causing a collision during backpressure will immediately retransmit without backoff reducing the chance of further collisions and ensuring transmit packets get sent
0 = The MAC will not remove the backoff

bit 12 **NOBKOFF:** No Backoff bit
1 = Following a collision, the MAC will immediately retransmit rather than using the Binary Exponential Backoff algorithm as specified in the Standard
0 = Following a collision, the MAC will use the Binary Exponential Backoff algorithm

bit 11-10 **Unimplemented:** Read as '0'

bit 9 **LONGPRE:** Long Preamble Enforcement bit
1 = The MAC only allows receive packets which contain preamble fields less than 12 bytes in length
0 = The MAC allows any length preamble as per the Standard

bit 8 **PUREPRE:** Pure Preamble Enforcement bit
1 = The MAC will verify the content of the preamble to ensure it contains 0x55 and is error-free. A packet with errors in its preamble is discarded
0 = The MAC does not perform any preamble checking

bit 7 **AUTOPAD:** Automatic Detect Pad Enable bit(1,2)
1 = The MAC will automatically detect the type of frame, either tagged or untagged, by comparing the two octets following the source address with 0x8100 (VLAN Protocol ID) and pad accordingly
0 = The MAC does not perform automatic detection

**Note 1:** Table 30-6 provides a description of the pad function based on the configuration of this register.
**2:** This bit is ignored if the PADENABLE bit is cleared.
**3:** This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware

**REGISTER 30-24: EMAC1CFG2: ETHERNET CONTROLLER MAC CONFIGURATION 2 REGISTER**

bit 6 **VLANPAD:** VLAN Pad Enable bit(1,2)
1 = The MAC will pad all short frames to 64 bytes and append a valid CRC
0 = The MAC does not perform padding of short frames

bit 5 **PADENABLE:** Pad/CRC Enable bit(1,3)
1 = The MAC will pad all short frames
0 = The frames presented to the MAC have a valid length

bit 4 **CRCENABLE:** CRC Enable1 bit
1 = The MAC will append a CRC to every frame whether padding was required or not. Must be set if the PADENABLE bit is set.
0 = The frames presented to the MAC have a valid CRC

bit 3 **DELAYCRC:** Delayed CRC bit
This bit determines the number of bytes, if any, of proprietary header information that exist on the front of the IEEE 802.3 frames.
1 = Four bytes of header (ignored by the CRC function)
0 = No proprietary header

bit 2 **HUGEFRM:** Huge Frame enable bit
1 = Frames of any length are transmitted and received
0 = Huge frames are not allowed for receive or transmit

bit 1 **LENGTHCK:** Frame Length checking bit
1 = Both transmit and receive frame lengths are compared to the Length/Type field. If the Length/Type field represents a length then the check is performed. Mismatches are reported on the transmit/receive statistics vector.
0 = Length/Type field check is not performed

bit 0 **FULLDPLX:** Full-Duplex Operation bit
1 = The MAC operates in Full-Duplex mode
0 = The MAC operates in Half-Duplex mode

**Note 1:** Table 30-6 provides a description of the pad function based on the configuration of this register.
**2:** This bit is ignored if the PADENABLE bit is cleared.
**3:** This bit is used in conjunction with the AUTOPAD and VLANPAD bits.

| **Note:** | Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware |

bit 31-7 **Unimplemented:** Read as '0'

bit 6-0 **B2BIPKTGP<6:0>:** Back-to-Back Interpacket Gap bits

This is a programmable field representing the nibble time offset of the minimum possible period between the end of any transmitted packet, to the beginning of the next. In Full-Duplex mode, the register value should be the desired period in nibble times minus 3. In Half-Duplex mode, the register value should be the desired period in nibble times minus 6. In Full-Duplex the recommended setting is 0x15 (21d), which represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps). In Half-Duplex mode, the recommended setting is 0x12 (18d), which also represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps).

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-15 **Unimplemented:** Read as '0'

bit 14-8 **NB2BIPKTGP1<6:0>:** Non-Back-to-Back Interpacket Gap Part 1 bits

This is a programmable field representing the optional carrierSense window referenced in section 4.2.3.2.1 "Deference" of the IEEE 80.23 Specification. If carrier is detected during the timing of IPGR1, the MAC defers to carrier. If, however, carrier becomes after IPGR1, the MAC continues timing IPGR2 and transmits, knowingly causing a collision, thus ensuring fair access to medium. Its range of values is 0x0 to IPGR2. Its recommend value is 0xC (12d).

bit 7 **Unimplemented:** Read as '0'

bit 6-0 **NB2BIPKTGP2<6:0>:** Non-Back-to-Back Interpacket Gap Part 2 bits

This is a programmable field representing the non-back-to-back Inter-Packet-Gap. Its recommended value is 0x12 (18d), which represents the minimum IPG of 0.96 µs (in 100 Mbps) or 9.6 µs (in 10 Mbps).

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 13-8 **CWINDOW<5:0>:** Collision Window bits

This is a programmable field representing the slot time or collision window during which collisions occur in properly configured networks. Since the collision window starts at the beginning of transmission, the preamble and SFD is included. Its default of 0x37 (55d) corresponds to the count of frame bytes at the end of the window.

bit 7-4 **Unimplemented:** Read as '0'

bit 3-0 **RETX<3:0>:** Retransmission Maximum bits

This is a programmable field specifying the number of retransmission attempts following a collision before aborting the packet due to excessive collisions. The Standard specifies the maximum number of attempts (attemptLimit) to be 0xF (15d). Its default is '0xF'.

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 31-16 **Unimplemented:** Read as '0'

bit 15-0 **MACMAXF<15:0>:** Maximum Frame Length bits(1)

These bits reset to 0x05EE, which represents a maximum receive frame of 1518 octets. An untagged maximum size Ethernet frame is 1518 octets. A tagged frame adds four octets for a total of 1522 octets. If a shorter/longer maximum length restriction is desired, program this 16-bit field.

**Note 1:** If a proprietary header is allowed, this bit should be adjusted accordingly. For example, if 4-byte headers are prepended to frames, MACMAXF could be set to 1527 octets. This would allow the maximum VLAN tagged frame plus the 4-byte header.

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

bit 3 **LINKFAIL:** Link Fail bit
When '1' is returned - indicates link fail has occurred. This bit reflects the value last read from the PHY status register.

bit 2 **NOTVALID:** MII Management Read Data Not Valid bit
When '1' is returned - indicates an MII management read cycle has not completed and the Read Data is not yet valid.

bit 1 **SCAN:** MII Management Scanning bit
When '1' is returned - indicates a scan operation (continuous MII Management Read cycles) is in progress.

bit 0 **MIIMBUSY:** MII Management Busy bit
When '1' is returned - indicates MII Management module is currently performing an MII Management Read or Write cycle.

**Note:** Both 16-bit and 32-bit accesses are allowed to these registers (including the SET, CLR and INV registers). 8-bit accesses are not allowed and are ignored by the hardware.

## 31.0 COMPARATOR

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. "Comparator"** (DS60001110) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

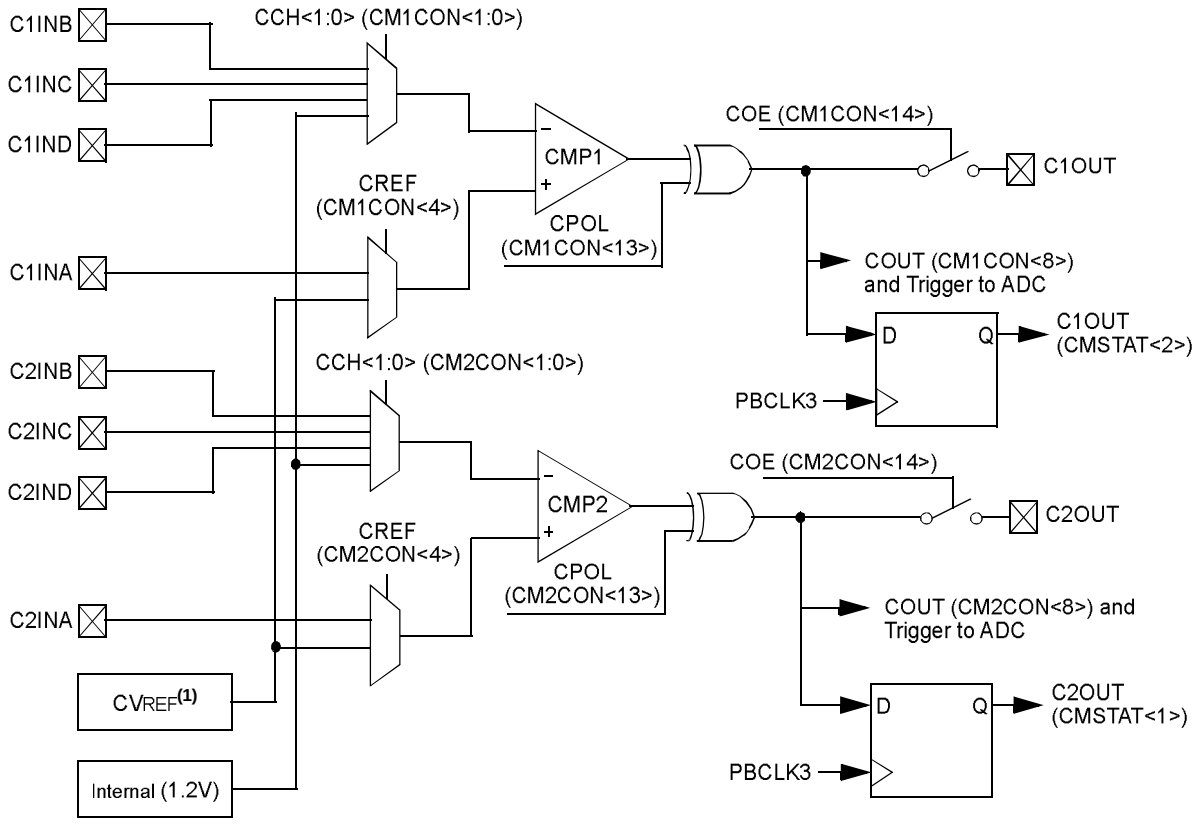

The Analog Comparator module consists of two comparators that can be configured in a variety of ways.

The following are key features of the Analog Comparator module:

- Differential inputs
- Rail-to-rail operation
- Selectable output polarity
- Selectable inputs:
  - Analog inputs multiplexed with I/O pins
  - On-chip internal absolute voltage reference
  - Comparator voltage reference (CVREF)
- Selectable interrupt generation

A block diagram of the comparator module is illustrated in Figure 31-1.

**FIGURE 31-1: COMPARATOR BLOCK DIAGRAM**

**Note 1:** Internally connected. See **Section 32.0 "Comparator Voltage Reference (CVREF)"** for more information.

## 32.0 COMPARATOR VOLTAGE REFERENCE (CVREF)

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 20. "Comparator Voltage Reference (CVREF)"** (DS60001109) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

The CVREF module is a 16-tap, resistor ladder network that provides a selectable reference voltage. Although its primary purpose is to provide a reference for the analog comparators, it also may be used independently of them.

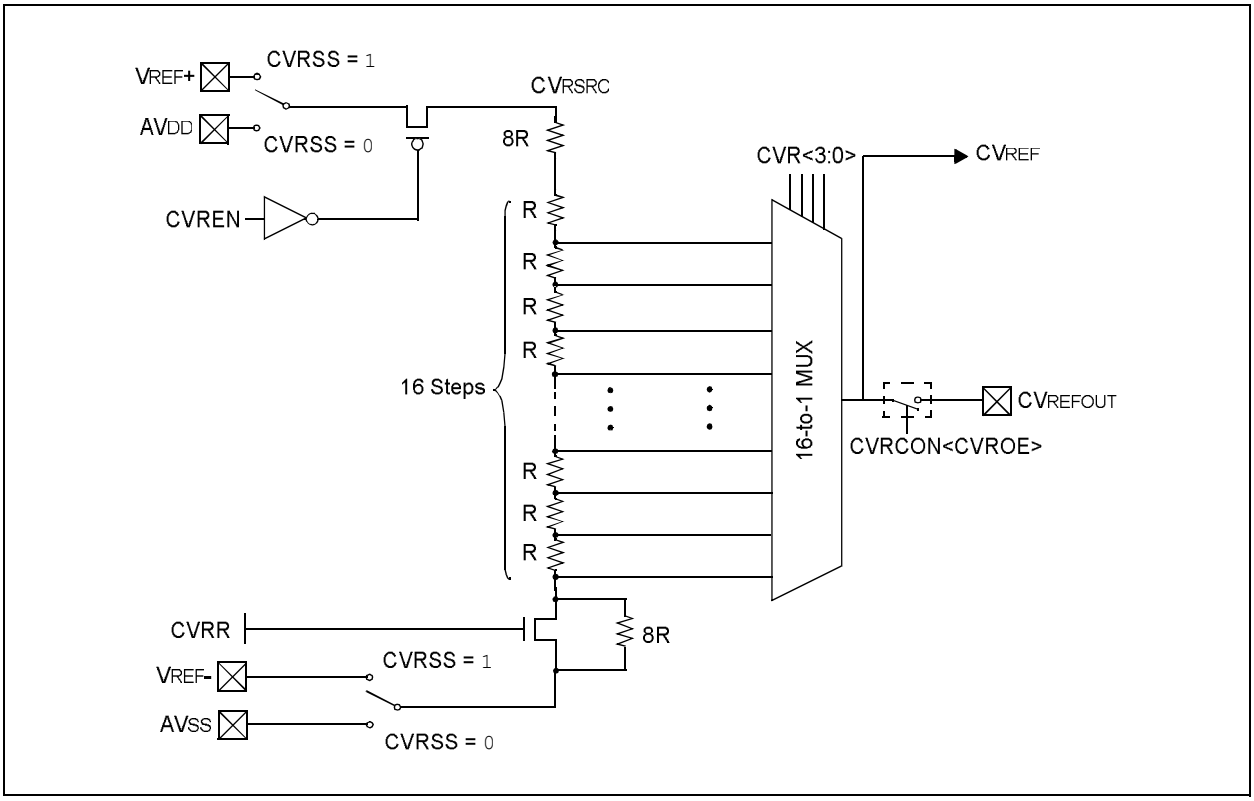

The resistor ladder is segmented to provide two ranges of voltage reference values and has a power-down function to conserve power when the reference is not being used. The module's supply reference can be provided from either device VDD/VSS or an external voltage reference. The CVREF output is available for the comparators and typically available for pin output.

The comparator voltage reference has the following features:

- High and low range selection
- Sixteen output levels available for each range
- Internally connected to comparators to conserve device pins
- Output can be connected to a pin

A block diagram of the CVREF module is illustrated in Figure 32-1.

## 33.0 POWER-SAVING FEATURES

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. "Power-Saving Features"** (DS60001130) in the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

This section describes power-saving features for the PIC32MZ EF devices. These devices offer various methods and modes that allow the user to balance power consumption with device performance. In all of the methods and modes described in this section, power-saving is controlled by software.

### 33.1 Power Saving with CPU Running

When the CPU is running, power consumption can be controlled by reducing the CPU clock frequency, lowering the speed of PBCLK7, or selecting a lower power clock source (i.e., LPRC or SOSC).

In addition, the Peripheral Bus Scaling mode is available for each peripheral bus where peripherals are clocked at reduced speed by selecting a higher divider for the associated PBCLKx, or by disabling the clock completely.

### 33.2 Power-Saving with CPU Halted

Peripherals and the CPU can be Halted or disabled to further reduce power consumption.

#### 33.2.1 SLEEP MODE

Sleep mode has the lowest power consumption of the device power-saving operating modes. The CPU and most peripherals are Halted and the associated clocks are disabled. Select peripherals can continue to operate in Sleep mode and can be used to wake the device from Sleep. See the individual peripheral module sections for descriptions of behavior in Sleep.

Sleep mode includes the following characteristics:

- There can be a wake-up delay based on the oscillator selection
- The Fail-Safe Clock Monitor (FSCM) does not operate during Sleep mode
- The BOR circuit remains operative during Sleep mode
- The WDT, if enabled, is not automatically cleared prior to entering Sleep mode
- Some peripherals can continue to operate at limited functionality in Sleep mode. These peripherals include I/O pins that detect a change in the input signal, WDT, ADC, UART and peripherals that use an external clock input or the internal LPRC oscillator (e.g., RTCC, Timer1 and Input Capture).
- I/O pins continue to sink or source current in the same manner as they do when the device is not in Sleep

The processor will exit, or 'wake-up', from Sleep on one of the following events:

- On any interrupt from an enabled source that is operating in Sleep. The interrupt priority must be greater than the current CPU priority.
- On any form of device Reset
- On a WDT time-out

If the interrupt priority is lower than or equal to the current priority, the CPU will remain Halted, but the peripheral bus clocks will start running and the device will enter into Idle mode.

#### 33.2.2 IDLE MODE

In Idle mode, the CPU is Halted; however, all clocks are still enabled. This allows peripherals to continue to operate. Peripherals can be individually configured to Halt when entering Idle by setting their respective SIDL bit. Latency, when exiting Idle mode, is very low due to the CPU oscillator source remaining active.

The device enters Idle mode when the SLPEN bit (OSCCON<4>) is clear and a `WAIT` instruction is executed.

The processor will wake or exit from Idle mode on the following events:

- On any interrupt event for which the interrupt source is enabled. The priority of the interrupt event must be greater than the current priority of the CPU. If the priority of the interrupt event is lower than or equal to current priority of the CPU, the CPU will remain Halted and the device will remain in Idle mode.
- On any form of device Reset
- On a WDT time-out interrupt

## 33.3 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have effect and read values are invalid.

To disable a peripheral, the associated PMDx bit must be set to '1'. To enable a peripheral, the associated PMDx bit must be cleared (default). See Table 33-1 for more information.

| | |
|---|---|
| **Note:** | Disabling a peripheral module while it's ON bit is set, may result in undefined behavior. The ON bit for the associated peripheral module must be cleared prior to disable a module via the PMDx bits. |

### 33.3.1 CONTROLLING CONFIGURATION CHANGES

Because peripherals can be disabled during run time, some restrictions on disabling peripherals are needed to prevent accidental configuration changes. PIC32MZ EF devices include two features to prevent alterations to enabled or disabled peripherals:

- Control register lock sequence
- Configuration bit select lock

#### 33.3.1.1 Control Register Lock

Under normal operation, writes to the PMDx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the PMDLOCK Configuration bit (CFGCON<12>). Setting PMDLOCK prevents writes to the control registers; clearing PMDLOCK allows writes.

To set or clear PMDLOCK, an unlock sequence must be executed. Refer to **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

#### 33.3.1.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the PMDx registers. The PMDL1WAY Configuration bit (DEVCFG3<28>) blocks the PMDLOCK bit from being cleared after it has been set once. If PMDLOCK remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable PMD functionality is to perform a device Reset.

## 34.0 SPECIAL FEATURES

**Note:** This data sheet summarizes the features of the PIC32MZ EF family of devices. However, it is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 32. "Configuration"** (DS60001124) and **Section 33. "Programming and Diagnostics"** (DS60001129) in the *"PIC32 Family Reference Manual"*, which are available from the Microchip web site (www.microchip.com/PIC32).

PIC32MZ EF devices include several features intended to maximize application flexibility and reliability and minimize cost through elimination of external components. These are:

- Flexible device configuration
- Joint Test Action Group (JTAG) interface
- In-Circuit Serial Programming™ (ICSP™)
- Internal temperature sensor

### 34.1 Configuration Bits

PIC32MZ EF devices contain two Boot Flash memories (Boot Flash 1 and Boot Flash 2), each with an associated configuration space. These configuration spaces can be programmed to contain various device configurations. Configuration space that is aliased by the Lower Boot Alias memory region is used to provide values for the following Configuration registers. See **4.1.1 "Boot Flash Sequence and Configuration Spaces"** for more information.

- DEVSIGN0/ADEVSIGN0: Device Signature Word 0 Register
- DEVCP0/ADEVCP0: Device Code-Protect 0 Register
- DEVCFG0/ADEVCFG0: Device Configuration Word 0
- DEVCFG1/ADEVCFG1: Device Configuration Word 1
- DEVCFG2/ADEVCFG2: Device Configuration Word 2
- DEVCFG3/ADEVCFG3: Device Configuration Word 3
- DEVADCx: Device ADC Calibration Word 'x' ('x' = 0-4, 7)

The following run-time programmable Configuration registers provide additional configuration control:

- CFGCON: Configuration Control Register
- CFGEBIA: External Bus Interface Address Pin Configuration Register
- CFGEBIC: External Bus Interface Control Pin Configuration Register
- CFGPG: Permission Group Configuration Register

In addition, the DEVID register provides device and revision information, and the DEVADC0-DEVADC4 and DEVADC7 registers provide ADC module calibration/configuration data. The DEVSN0, DEVSN1, DEVSN2, and DEVSN3 registers contain a unique serial number of the device.

**Note:** Do not use Word program operation (NVMOP<3:0> = `0001`) when programming the device Words that are described in this section.

bit 7 **IOANCPEN:** I/O Analog Charge Pump Enable bit

The analog IO charge pump improves analog performance when the device is operating at lower voltages. However, the charge pumps consume additional current.

1 = Charge pump is enabled

0 = Charge pump is disabled

**Note:** 1) For proper analog operation at VDD is less than 2.5V, the AICPMPEN bit (ADCCON1<12>) must be = 1 and the IOANCPEN bit must be set to '1;' however, the charge pumps will consume additional current. These bits should not be set if VDD is greater than 2.5V.

2) ADC throughput rate performance is reduced as defined in the table below if ADCCON1<AICPMPEN> = 1 and CFGCON<IOANCPEN> = 1.

## 34.3 On-Chip Voltage Regulator

The core and digital logic for all PIC32MZ EF devices is designed to operate at a nominal 1.8V. To simplify system designs, devices in the PIC32MZ EF family incorporate an on-chip regulator providing the required core logic voltage from VDD.

### 34.3.1 ON-CHIP REGULATOR AND POR

It takes a fixed delay for the on-chip regulator to generate an output. During this time, designated as TPU, code execution is disabled. TPU is applied every time the device resumes operation after any power-down, including Sleep mode.

### 34.3.2 ON-CHIP REGULATOR AND BOR

PIC32MZ EF devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset. This event is captured by the BOR flag bit (RCON<1>). The brown-out voltage levels are specific in **Section 37.1 "DC Characteristics"**.

## 34.4 On-chip Temperature Sensor

PIC32MZ EF devices include a temperature sensor that provides accurate measurement of a device's junction temperature (see **Section 37.2 "AC Characteristics and Timing Parameters"** for more information).

The temperature sensor is connected to the ADC module and can be measured using the shared S&H circuit (see **Section 28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** for more information).

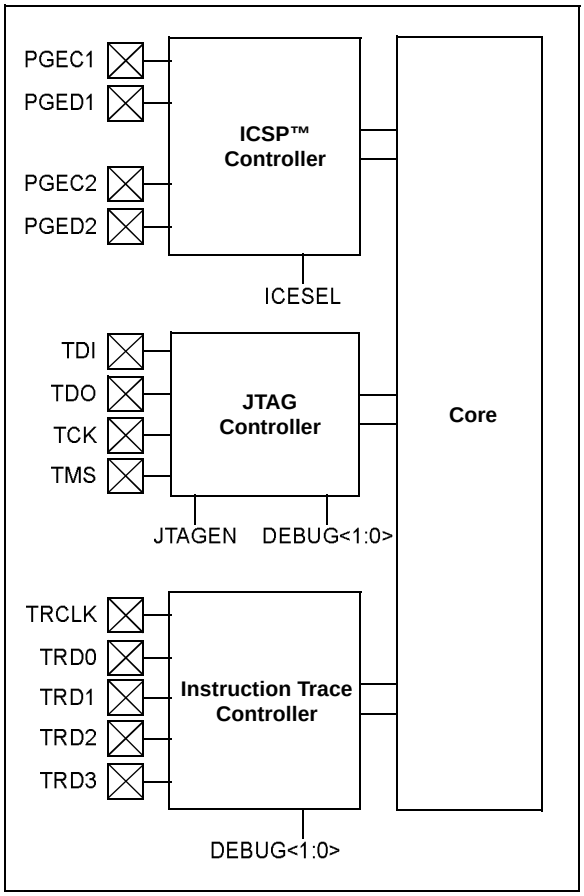

## 34.5 Programming and Diagnostics

PIC32MZ EF devices provide a complete range of programming and diagnostic features that can increase the flexibility of any application using them. These features allow system designers to include:

- Simplified field programmability using two-wire In-Circuit Serial Programming™ (ICSP™) interfaces
- Debugging using ICSP
- Programming and debugging capabilities using the EJTAG extension of JTAG
- JTAG boundary scan testing for device and board diagnostics

PIC32 devices incorporate two programming and diagnostic modules, and a trace controller, that provide a range of functions to the application developer.

## 35.0 INSTRUCTION SET

The PIC32MZ EF family instruction set complies with the MIPS32® Release 5 instruction set architecture. The PIC32MZ EF device family *does not* support the following features:

- Core extend instructions
- Coprocessor 2 instructions

## 36.1 MPLAB X Integrated Development Environment Software

The MPLAB X IDE is a single, unified graphical user interface for Microchip and third-party software, and hardware development tool that runs on Windows®, Linux and Mac OS® X. Based on the NetBeans IDE, MPLAB X IDE is an entirely new IDE with a host of free software components and plug-ins for high-performance application development and debugging. Moving between tools and upgrading from software simulators to hardware debugging and programming tools is simple with the seamless user interface.

With complete project management, visual call graphs, a configurable watch window and a feature-rich editor that includes code completion and context menus, MPLAB X IDE is flexible and friendly enough for new users. With the ability to support multiple tools on multiple projects with simultaneous debugging, MPLAB X IDE is also suitable for the needs of experienced users.

Feature-Rich Editor:

- Color syntax highlighting
- Smart code completion makes suggestions and provides hints as you type
- Automatic code formatting based on user-defined rules
- Live parsing

User-Friendly, Customizable Interface:

- Fully customizable interface: toolbars, toolbar buttons, windows, window placement, etc.
- Call graph window

Project-Based Workspaces:

- Multiple projects
- Multiple tools
- Multiple configurations
- Simultaneous debugging sessions

File History and Bug Tracking:

- Local file history feature
- Built-in support for Bugzilla issue tracker

## 36.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16, and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

## 36.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

## 36.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

## 36.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

## 36.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

## 36.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

## 36.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

## 36.9 PICkit 3 In-Circuit Debugger/ Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a full-speed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming™ (ICSP™).

## 36.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at $V_{DDMIN}$ and $V_{DDMAX}$ for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.

## 36.11 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

## 36.12 Third-Party Development Tools

Microchip also offers a great collection of tools from third-party vendors. These tools are carefully selected to offer good value and unique functionality.

- Device Programmers and Gang Programmers from companies, such as SoftLog and CCS
- Software Tools from companies, such as Gimpel and Trace Systems
- Protocol Analyzers from companies, such as Saleae and Total Phase
- Demonstration Boards from companies, such as MikroElektronika, Digilent® and Olimex
- Embedded Ethernet Solutions from companies, such as EZ Web Lynx, WIZnet and IPLogika®

## 37.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC32MZ EF devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

Specifications for Extended Temperature devices (-40ºC to +125ºC) that are different from the specifications in this section are provided in **38.0 "Extended Temperature Electrical Characteristics"**.

### Absolute Maximum Ratings

**(See Note 1)**

| | |
|---|---|
| Ambient temperature under bias | -40°C to +85°C |
| Storage temperature | -65°C to +150°C |
| Voltage on $V_{DD}$ with respect to $V_{SS}$ | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant, with respect to $V_{SS}$ **(Note 3)** | -0.3V to ($V_{DD}$ + 0.3V) |
| Voltage on any 5V tolerant pin with respect to $V_{SS}$ when $V_{DD} \geq 2.1V$ **(Note 3)** | -0.3V to +5.5V |
| Voltage on any 5V tolerant pin with respect to $V_{SS}$ when $V_{DD} < 2.1V$ **(Note 3)** | -0.3V to +3.6V |
| Voltage on D+ or D- pin with respect to $V_{USB3V3}$ | -0.3V to ($V_{USB3V3}$ + 0.3V) |
| Voltage on $V_{BUS}$ with respect to $V_{SS}$ | -0.3V to +5.5V |
| Maximum current out of $V_{SS}$ pin(s) | 200 mA |
| Maximum current into $V_{DD}$ pin(s) **(Note 2)** | 200 mA |
| Maximum current sunk/sourced by any 4x I/O pin **(Note 4)** | 15 mA |
| Maximum current sunk/sourced by any 8x I/O pin **(Note 4)** | 25 mA |
| Maximum current sunk/sourced by any 12x I/O pin **(Note 4)** | 33 mA |
| Maximum current sunk by all ports | 150 mA |
| Maximum current sourced by all ports **(Note 2)** | 150 mA |

**Note 1:** Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**2:** Maximum allowable current is a function of device maximum power dissipation (see Table 37-2).

**3:** See the pin name tables (Table 2 through Table 4) for the 5V tolerant pins.

**4:** Characterized, but not tested. Refer to parameters DO10, DO20, and DO20a for the 4x, 8x, and 12x I/O pin lists.

## 37.1 DC Characteristics

**TABLE 37-1: OPERATING MIPS VS. VOLTAGE**

| Characteristic | VDD Range (in Volts) (Note 1) | Temp. Range (in °C) | Max. Frequency | Comment |

**Note 1:** A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

**2:** The test conditions for IDD measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
- CPU, Program Flash, and SRAM data memory are operational, Program Flash memory Wait states are equal to two
- L1 Cache and Prefetch modules are enabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled

**3:** Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

**4:** This parameter is characterized, but not tested in manufacturing.

**5:** Note 2 applies with the following exceptions: L1 Cache and Prefetch modules are disabled, Program Flash memory Wait states are equal to seven.

**6:** Data in the "Maximum" column is at 3.3V, +85ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

| DC34 | 26 | 48 | mA | 180 MHz **(Note 3)** |
| DC35 | 28 | 52 | mA | 200 MHz |

**Note 1:** The test conditions for $I_{IDLE}$ current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBPMD = 1), $V_{USB3V3}$ is connected to $V_{SS}$, PBCLKx divisor = 1:128 ('x' ≠ 7)
- CPU is in Idle mode (CPU core Halted)
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBPMD)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to $V_{SS}$
- $\overline{MCLR}$ = $V_{DD}$
- RTCC and JTAG are disabled

**2:** Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**Note 1:** Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**2:** The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

**3:** Negative current is defined as current sourced by the pin.

**4:** This parameter is characterized, but not tested in manufacturing.

**5:** See the pin name tables (Table 2 through Table 4) for the 5V-tolerant pins.

**6:** The VIH specifications are only in relation to externally applied inputs, and not with respect to the user-selectable internal pull-ups. External open drain input signals utilizing the internal pull-ups of the PIC32 device are guaranteed to be recognized only as a logic "high" internally to the PIC32 device, provided that the external load does not exceed the minimum value of ICNPU. For External "input" logic inputs that require a pull-up source, to guarantee the minimum VIH of those components, it is recommended to use an external pull-up resistor rather than the internal pull-ups of the PIC32 device.

| DI60a | IICL | **Input Low Injection Current** | 0 | — | -5(2,5) | mA | This parameter applies to all pins, with the exception of RB10. Maximum IICH current for this exception is 0 mA. |
| DI60b | IICH | **Input High Injection Current** | 0 | — | +5(3,4,5) | mA | This parameter applies to all pins, with the exception of all 5V tolerant pins, OSCI, OSCO, SOSCI, SOSCO, D+, D- and RB10. Maximum IICH current for these exceptions is 0 mA. |
| DI60c | ∑IICT | **Total Input Injection Current (sum of all I/O and control pins)** | -20(6) | — | +20(6) | mA | Absolute instantaneous sum of all ± input injection currents from all I/O pins<br>( \| IICL + \| IICH \| ) ≤ ∑IICT |

**Note 1:** Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**2:** VIL source < (VSS - 0.3). Characterized but not tested.

**3:** VIH source > (VDD + 0.3) for non-5V tolerant pins only.

**4:** Digital 5V tolerant pins do not have an internal high side diode to VDD, and therefore, cannot tolerate any "positive" input injection current.

**5:** Injection currents > | 0 | can affect the ADC results by approximately 4 to 6 counts (i.e., VIH Source > (VDD + 0.3) or VIL source < (VSS - 0.3)).

**6:** Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted provided the "absolute instantaneous" sum of the input injection currents from all pins do not exceed the specified limit. If **Note 2**, IICL = (((Vss - 0.3) - VIL source) / Rs). If **Note 3**, IICH = ((IICH source - (VDD + 0.3)) / RS). RS = Resistance between input source voltage and device pin. If (VSS - 0.3) ≤ VSOURCE ≤ (VDD + 0.3), injection current = 0.

**2:** This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} \quad \frac{D_{CLK}}{1.41}$$

## 38.0 EXTENDED TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics for devices running up to 125ºC. Additional information will be provided in future revisions of this document as it becomes available.

The specifications for Extended Temperature are identical to those shown in **37.0 "Electrical Characteristics"**, with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter "E", which denotes Extended Temperature operation. For example, parameter DC28 in **37.0 "Electrical Characteristics"**, is the Extended Temperature operation equivalent for EDC28.

Absolute maximum ratings for the PIC32MZ EF devices are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions, above the parameters indicated in the operation listings of this specification, is not implied.

### Absolute Maximum Ratings
**(See Note 1)**

Ambient temperature under bias.....-40°C to +125°C

| | | |
|---|---|---|
| **Note** | **1:** | Stresses above those listed under **"Absolute Maximum Ratings"** may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. |

## 38.1 DC Characteristics

**TABLE 38-1: OPERATING MIPS VS. VOLTAGE**

| Characteristic | VDD Range (in Volts) (Note 1) | Temp. Range (in °C) | Max. Frequency | Comment |
|---|---|---|---|---|
| | | | PIC32MZ EF Devices | |
| EDC5 | 2.1V-3.6V | -40°C to +125°C | 180 MHz | — |

**Note 1:** Overall functional device operation at VBORMIN < VDD < VDDMIN is guaranteed, but not characterized. All device Analog modules, such as ADC, etc., will function, but with degraded performance below VDDMIN. Refer to parameter BO10 in Table 37-5 for BOR values.

**TABLE 38-2: DC CHARACTERISTICS: OPERATING CURRENT (IDD)**

| DC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +125°C for Extended | |
|---|---|---|---|---|
| Parameter No. | Typical(3) | Maximum(6) | Units | Conditions |
| **Operating Current (IDD)(1)** | | | | |
| EDC20 | 8 | 54 | mA | 4 MHz **(Note 4,5)** |
| EDC21 | 10 | 60 | mA | 10 MHz **(Note 5)** |
| EDC22 | 32 | 95 | mA | 60 MHz **(Note 2,4)** |
| EDC23 | 40 | 105 | mA | 80 MHz **(Note 2,4)** |
| EDC25 | 61 | 125 | mA | 130 MHz **(Note 2,4)** |
| EDC26 | 72 | 140 | mA | 160 MHz **(Note 2,4)** |
| EDC28 | 81 | 150 | mA | 180 MHz **(Note 2,4)** |

**Note 1:** A device's IDD supply current is mainly a function of the operating voltage and frequency. Other factors, such as PBCLK (Peripheral Bus Clock) frequency, number of peripheral modules enabled, internal code execution pattern, I/O pin loading and switching rate, oscillator type, as well as temperature, can have an impact on the current consumption.

**2:** The test conditions for IDD measurements are as follows:

- Oscillator mode is EC+PLL with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), VUSB3V3 is connected to VSS
- CPU, Program Flash, and SRAM data memory are operational, Program Flash memory Wait states are equal to four
- L1 Cache and Prefetch modules are enabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to VSS
- $\overline{MCLR}$ = VDD
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled

**3:** Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

**4:** This parameter is characterized, but not tested in manufacturing.

**5:** Note 2 applies with the following exceptions: L1 Cache and Prefetch modules are disabled, Program Flash memory Wait states are equal to seven.

**6:** Data in the "Maximum" column is at 3.3V, +125ºC at specified operating frequency. Parameters are for design guidance only and are not tested.

| **Idle Current ($I_{IDLE}$): Core Off, Clock on Base Current (Note 1)** | | | | |
| EDC30a | 7 | 52 | mA | 4 MHz **(Note 3)** |
| EDC31a | 8 | 56 | mA | 10 MHz |
| EDC32a | 13 | 66 | mA | 60 MHz **(Note 3)** |
| EDC33a | 21 | 86 | mA | 130 MHz **(Note 3)** |
| EDC34 | 26 | 96 | mA | 180 MHz **(Note 3)** |

**Note 1:** The test conditions for $I_{IDLE}$ current measurements are as follows:

- Oscillator mode is EC+PLL with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBPMD = 1), $V_{USB3V3}$ is connected to $V_{SS}$, PBCLKx divisor = 1:128 ('x' ≠ 7)
- CPU is in Idle mode (CPU core Halted)
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBPMD)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to $V_{SS}$
- $\overline{MCLR}$ = $V_{DD}$
- RTCC and JTAG are disabled

**2:** Data in "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**3:** This parameter is characterized, but not tested in manufacturing.

**4:** Data in the "Maximum" column is at 3.3V, +125ºC at specified operating frequency. Parameters are for design guidance only and are not tested.

| **Power-Down Current ($I_{PD}$) (Note 1)** | | | | | |
| EDC40m | 20 | 46 | mA | +125ºC | Base Power-Down Current |
| **Module Differential Current** | | | | | |
| EDC41e | 15 | 50 | µA | 3.6V | Watchdog Timer Current: $\Delta I_{WDT}$ **(Note 3)** |
| EDC42e | 25 | 50 | µA | 3.6V | RTCC + Timer1 w/32 kHz Crystal: $\Delta I_{RTCC}$ **(Note 3)** |
| EDC43d | 3 | 3.8 | mA | 3.6V | ADC: $\Delta I_{ADC}$ **(Notes 3, 4)** |
| EDC44 | 15 | 50 | µA | 3.6V | Deadman Timer Current: $\Delta I_{DMT}$ **(Note 3)** |

**Note 1:** The test conditions for $I_{PD}$ current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBMD = 1), $V_{USB3V3}$ is connected to $V_{SS}$
- CPU is in Sleep mode
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), and the associated PMD bit is set. All clocks are disabled ON bit (PBxDIV<15>) = 0 (x ≠ 1,7)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to $V_{SS}$
- $\overline{MCLR}$ = $V_{DD}$
- RTCC and JTAG are disabled
- Voltage regulator is in Stand-by mode (VREGS = 0)

**2:** Data in the "Typical" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**3:** The Δ current is the additional current consumed when the module is enabled. This current should be added to the base $I_{PD}$ current.

**4:** Voltage regulator is operational (VREGS = 1).

**5:** Data in the "Maximum" column is at 3.3V, +125ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

**Note 1:** These parameters are characterized, but not tested in manufacturing.

**2:** This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} \quad \frac{D_{CLK}}{1.41}$$

## 39.0 252 MHz ELECTRICAL CHARACTERISTICS

This section provides an overview of the PIC32MZ EF electrical characteristics for devices running at 252 MHz. Additional information will be provided in future revisions of this document as it becomes available.

The specifications for 252 MHz are identical to those shown in **37.0 "Electrical Characteristics"** including absolute maximum ratings, with the exception of the parameters listed in this chapter.

Parameters in this chapter begin with the letter "M", which denotes 252 MHz operation. For example, parameter DC27a in **37.0 "Electrical Characteristics"**, is the up to 200 MHz operation equivalent for MDC27a.

- $\overline{MCLR}$ = VDD
- CPU executing `while(1)` statement from Flash
- RTCC and JTAG are disabled

**3:** Data in "Typical" column is at 3.3V, +25°C at specified operating frequency unless otherwise stated. Parameters are for design guidance only and are not tested.

**4:** This parameter is characterized, but not tested in manufacturing.

**5:** Note 2 applies with the following exceptions: L1 Cache and Prefetch modules are disabled, Program Flash memory Wait states are equal to seven.

**6:** Data in the "Maximum" column is at 3.3V, +85ºC at specified operating frequency, unless otherwise stated. Parameters are for design guidance only and are not tested.

| **Idle Current ($I_{IDLE}$): Core Off, Clock on Base Current (Note 1)** | | | | |
| MDC35 | 41 | 60 | mA | 252 MHz |

**Note 1:** The test conditions for $I_{IDLE}$ current measurements are as follows:

- Oscillator mode is EC+PLL with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL is disabled (USBPMD = 1), $V_{USB3V3}$ is connected to $V_{SS}$, PBCLKx divisor = 1:128 ('x' ≠ 7)
- CPU is in Idle mode (CPU core Halted)
- L1 Cache and Prefetch modules are disabled
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared (except USBPMD)
- WDT, DMT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to $V_{SS}$
- $\overline{MCLR}$ = $V_{DD}$
- RTCC and JTAG are disabled

## 39.2 AC Characteristics and Timing Parameters

The information contained in this section defines PIC32MZ EF device AC characteristics and timing parameters.

**TABLE 39-5: SYSTEM TIMING REQUIREMENTS**

| AC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +85°C for Industrial | | | | |
|---|---|---|---|---|---|---|---|
| **Param. No.** | **Symbol** | **Characteristics** | **Minimum** | **Typical** | **Maximum** | **Units** | **Conditions** |
| MOS51 | FSYS | System Frequency | DC | — | 252 | MHz | USB module disabled |
| | | | 60 | — | 252 | MHz | USB module enabled |
| MOS55a | FPB | Peripheral Bus Frequency | DC | — | 100 | MHz | For PBCLKx, 'x' ≠ 4, 7 (see **Note 1**) |
| MOS55b | | | DC | — | 200 | MHz | For PBCLK4 |
| MOS55c | | | DC | — | 252 | MHz | For PBCLK7 |
| MOS56 | FREF | Reference Clock Frequency | — | — | 50 | MHz | For REFCLKI1, 3, 4 and REFCLKO1, 3, 4 pins |

**Note 1:** If the DEVCFG registers are configured for a SYSCLK speed greater than 200 MHz, these PBCLKs will be running faster than the maximum rating when the device comes out of Reset. To ensure proper operation, firmware must start the device at a speed less than or equal to 200 MHz, adjust the speed of the PBCLKs, and then raise the SYSCLK speed to the desired speed.

**TABLE 39-6: PLL CLOCK TIMING SPECIFICATIONS**

| AC CHARACTERISTICS | | | Standard Operating Conditions: 2.1V to 3.6V (unless otherwise stated)<br>Operating temperature -40°C ≤ TA ≤ +85°C for Industrial | | | | |
|---|---|---|---|---|---|---|---|
| **Param. No.** | **Symbol** | **Characteristics(1)** | **Min.** | **Typical** | **Max.** | **Units** | **Conditions** |
| MOS54a | FPLL | PLL Output Frequency Range | 10 | — | 252 | MHz | — |

**Note 1:** These parameters are characterized, but not tested in manufacturing.

**2:** This jitter specification is based on clock-cycle by clock-cycle measurements. To get the effective jitter for individual time-bases on communication clocks, use the following formula:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{PBCLK2}{CommunicationClock}}}$$

For example, if PBCLK2 = 100 MHz and SPI bit rate = 50 MHz, the effective jitter is as follows:

$$EffectiveJitter \quad \frac{D_{CLK}}{\sqrt{\frac{100}{50}}} \quad \frac{D_{CLK}}{1.41}$$

# APPENDIX A: MIGRATING FROM PIC32MX5XX/6XX/7XX TO PIC32MZ EF

This appendix provides an overview of considerations for migrating from PIC32MX5XX/6XX/7XX devices to the PIC32MZ EF family of devices. The code developed for PIC32MX5XX/6XX/7XX devices can be ported to PIC32MZ EF devices after making the appropriate changes outlined in the following sections.

The PIC32MZ EF devices are based on a new architecture, and feature many improvements and new capabilities over PIC32MX5XX/6XX/7XX devices.

## A.1 Oscillator and PLL Configuration

Because the maximum speed of the PIC32MZ EF family is greater, the configuration of the oscillator is different from prior PIC32MX5XX/6XX/7XX devices.

Oscillator Configuration differences summarizes the differences (indicated by **Bold** type) between the family devices for the oscillator.

**TABLE A-1: OSCILLATOR CONFIGURATION DIFFERENCES**

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| **Primary Oscillator Configuration** | |
| On PIC32MX devices, XT mode had to be selected if the input frequency was in the 3 MHz to 10 MHz range (4-10 for PLL), and HS mode had to be selected if the input frequency was in the 10 MHz to 20 MHz range. | On PIC32MZ EF devices, HS mode has a wider input frequency range (4 MHz to 12 MHz). The bit setting of '01' is Reserved. |
| POSCMOD<1:0> (DEVCFG1<9:8>)<br>11 = Primary Oscillator disabled<br>10 = HS Oscillator mode selected<br>**01 = XT Oscillator mode selected**<br>00 = External Clock mode selected | POSCMOD<1:0> (DEVCFG1<9:8>)<br>11 = Primary Oscillator disabled<br>10 = HS Oscillator mode selected<br>**01 = Reserved**<br>00 = External Clock mode selected |
| On PIC32MX devices, crystal mode could be selected with the HS or XT POSC setting, but an external oscillator could be fed into the OSC1/CLKI pin and the part would operate normally. | On PIC32MZ devices, this option is not available. External oscillator signals should only be fed into the OSC1/CLKI pin with the POSC set to EC mode. |
| **Oscillator Selection** | |
| On PIC32MX devices, clock selection choices are as follows:<br>FNOSC<2:0> (DEVCFG1<2:0>)<br>NOSC<2:0> (OSCCON<10:8>)<br>111 = FRCDIV<br>**110 = FRCDIV16**<br>101 = LPRC<br>100 = SOSC<br>**011 = POSC with PLL module**<br>010 = POSC (XT, HS, EC)<br>**001 = FRCDIV+PLL**<br>**000 = FRC**<br>COSC<2:0> (OSCCON<14:12>)<br>111 = FRC divided by FRCDIV<br>**110 = FRC divided by 16**<br>101 = LPRC<br>100 = SOSC<br>**011 = POSC + PLL module**<br>010 = POSC<br>**001 = FRCPLL**<br>**000 = FRC** | On PIC32MZ EF devices, clock selection choices are as follows:<br>FNOSC<2:0> (DEVCFG1<2:0>)<br>NOSC<2:0> (OSCCON<10:8>)<br>111 = FRCDIV<br>**110 = Reserved**<br>101 = LPRC<br>100 = SOSC<br>**011 = Reserved**<br>010 = POSC (HS or EC)<br>**001 = System PLL (SPLL)**<br>**000 = FRCDIV**<br>COSC<2:0> (OSCCON<14:12>)<br>111 = FRC divided by FRCDIV<br>**110 = BFRC**<br>101 = LPRC<br>100 = SOSC<br>**011 = Reserved**<br>010 = POSC<br>**001 = System PLL**<br>**000 = FRC divided by FRCDIV** |

## A.2 Analog-to-Digital Converter (ADC)

The PIC32MZ EF family of devices has a new 12-bit High-Speed Successive Approximation Register (SAR) ADC module that replaces the 10-bit ADC module in PIC32MX5XX/6XX/7XX devices; therefore, the use of **Bold** type to show differences is *not* used in the following table. Note that not all register differences are described in this section; however, the key feature differences are listed in ADC Differences.

**TABLE A-3: ADC DIFFERENCES**

## A.3 CPU

The CPU in the PIC32MZ EF family of devices has been changed to the MIPS32 M-Class MPU architecture. This CPU includes DSP ASE, internal data and instruction L1 caches, and a TLB-based MMU.

CPU Differences summarizes some of the key differences (indicated by **Bold** type) in the internal CPU registers.

## A.4 Resets

The PIC32MZ EF family of devices has updated the resets modules to incorporate the new handling of NMI resets from the WDT, DMT, and the FSCM. In addition, some bits have been moved, as summarized in Reset Differences.

**TABLE A-5: RESET DIFFERENCES**

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| **Power Reset** | |
| | The VREGS bit, which controls whether the internal regulator is enabled in Sleep mode, has been moved from RCON in PIC32MX5XX/6XX/7XX devices to a new PWRCON register in PIC32MZ EF devices. |

| **Watchdog Timer Reset** | |
| On PIC32MX devices, a WDT expiration immediately triggers a device reset. | On PIC32MZ EF devices, the WDT expiration now causes a NMI. The WDTO bit in RNMICON indicates that the WDT caused the NMI. A new timer, NMICNT, runs when the WDT NMI is triggered, and if it expires, the device is reset. |

## A.5 USB

The PIC32MZ EF family of devices has a new Hi-Speed USB module, which requires the updated USB stack from Microchip. In addition, the USB PLL was also updated. See **A.1 "Oscillator and PLL Configuration"** for more information and USB Differences for a list of additional differences.

**TABLE A-6: USB DIFFERENCES**

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| **Debug Mode** | |
| On PIC32MX devices, when stopping on a breakpoint during debugging, the USB module can be configured to stop or continue execution from the Freeze Peripherals dialog in MPLAB X IDE. | On PIC32MZ EF devices, the USB module continues operating when stopping on a breakpoint during debugging. |
| **VBUSON Pin** | |
| PIC32MX devices feature a VBUSON pin for controlling the external transceiver power supply. | On PIC32MZ EF devices, the VBUSON pin is not available. A port pin can be used to achieve the same functionality. |

## A.6 DMA

The DMA controller in PIC32MZ EF devices is similar to the DMA controller in PIC32MX5XX/6XX/7XX devices. New features include the extension of pattern matching to two by bytes and the addition of the optional Pattern Ignore mode. DMA Differences lists differences (indicated by **Bold** type) that will affect software migration.

**TABLE A-7: DMA DIFFERENCES**

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| **Read/Write Status on Error** | |
| | The RDWR bit has moved from DMASTAT<3> in PIC32MX5XX/6XX/7XX devices to DMASTAT<31> in PIC32MZ EF devices. |
| RDWR (DMASTAT<**3**>)<br>1 = Last DMA bus access when an error was detected was a read<br>0 = Last DMA bus access when an error was detected was a write | RDWR (DMASTAT<**31**>)<br>1 = Last DMA bus access when an error was detected was a read<br>0 = Last DMA bus access when an error was detected was a write |
| **Source-to-Destination Transfer** | |
| On PIC32MX devices, a DMA channel performs a read of the source data and completes the transfer of this data into the destination address before it is ready to read the next data from the source. | On PIC32MZ EF devices, the DMA implements a 4-deep queue for data transfers. A DMA channel reads the source data and places it into the queue, regardless of whether previous data in the queue has been delivered to the destination address. |

## A.7 Interrupts and Exceptions

The key difference between Interrupt Controllers in PIC32MX5XX/6XX/7XX devices and PIC32MZ EF devices concerns vector spacing. Previous PIC32MX devices had fixed vector spacing, which is adjustable in set increments, and every interrupt had the same amount of space. PIC32MZ EF devices replace this with a variable offset spacing, where each interrupt has an offset register to determine where to begin execution.

In addition, the IFSx, IECx, and IPCx registers for old peripherals have shifted to different registers due to new peripherals. Please refer to **7.0 "CPU Exceptions and Interrupt Controller"** to determine where the interrupts are now located.

Interrupt Differences lists differences (indicated by **Bold** type) in the registers that will affect software migration.

**TABLE A-8: INTERRUPT DIFFERENCES**

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| **Vector Spacing** | |
| On PIC32MX devices, the vector spacing was determined by the VS field in the CPU core.<br><br>**VS<4:0> (IntCtl<9:5>: CP0 Register 12, Select 1)**<br>**10000 = 512-byte vector spacing**<br>**01000 = 256-byte vector spacing**<br>**00100 = 128-byte vector spacing**<br>**00010 = 64-byte vector spacing**<br>**00001 = 32-byte vector spacing**<br>**00000 = 0-byte vector spacing** | On PIC32MZ EF devices, the vector spacing is variable and determined by the Interrupt controller. | **Shadow Register Sets** | |
| On PIC32MX devices, there was one shadow register set which could be used during interrupt processing. Which interrupt priority could use the shadow register set was determined by the FSRSSEL field in DEVCFG3 and SS0 on INTCON.<br><br>**FSRSSEL<2:0> (DEVCFG3<18:16>)**<br>**111 = Assign Interrupt Priority 7 to a shadow register set**<br>**110 = Assign Interrupt Priority 6 to a shadow register set**<br>•<br>•<br>•<br>**001 = Assign Interrupt Priority 1 to a shadow register set**<br>**000 = All interrupt priorities are assigned to a shadow register set**<br><br>SS0 (**INTCON<16>**)<br>1 = Single vector is presented with a shadow register set<br>0 = Single vector is not presented with a shadow register set | On PIC32MZ EF devices, there are seven shadow register sets, and each priority level can be assigned a shadow register set to use via the PRIxSS<3:0> bits in the PRISS register. ## A.8 Flash Programming

The PIC32MZ EF family of devices incorporates a new Flash memory technology. Applications ported from PIC32MX5XX/6XX/7XX devices that take advantage of Run-time Self Programming will need to adjust the Flash programming steps to incorporate these changes.

Flash Programming Differences lists the differences (indicated by **Bold** type) that will affect software migration.

## A.9 Other Peripherals and Features

Most of the remaining peripherals on PIC32MZ EF devices act identical to their counterparts on PIC32MX-5XX/6XX/7XX devices. The main differences have to do with handling the increased peripheral bus clock speed and additional clock sources.

Peripheral Differences lists the differences (indicated by **Bold** type) that will affect software and hardware migration.

| **Change Notification** | |
| On PIC32MX devices, Change Notification is controlled by the **CNCON, CNEN, and CNPUE** registers. | On PIC32MZ EF devices, Change Notification functionality has been relocated into each I/O port and is controlled by the **CNPUx, CNPDx, CNCONx, CNENx, and CNSTATx** registers. |
| **System Bus** | |
| On PIC32MX devices, the System Bus registers can be used to configure RAM memory for data and program memory partitions, cacheability of Flash memory, and RAM Wait states. These registers are: **BMXCON, BMXDKPBA, BMXDUDBA, BMXDUPBA, BMXPUPBA, BMXDRMSZ, BMXPFMSZ, and BMXBOOTSZ.** | On PIC32MZ EF devices, a new System Bus is utilized that supports using RAM memory for program or data without the need for special configuration. Therefore, no special registers are associated with the System Bus to configure these features. |
| On PIC32MX devices, various arbitration modes are used as initiators on the System Bus. These modes can be selected by the **BMXARB<2:0> (BMXCON<2:0>)** bits. | On PIC32MZ EF devices, a new arbitration scheme has been implemented on the System Bus. All initiators use the Least Recently Serviced (LRS) scheme, with the exception of the DMA, CPU, and the Flash Controller.<br>The Flash Controller always has High priority over LRS initiators.<br>The DMA and CPU (when servicing an interrupt) can be selected to have LRS or High priority using the **DMAPRI (CFGCON<25>)** and **CPUPRI (CFGCON<24>)** bits. |

## A.10 Package Differences

In general, PIC32MZ EF devices are mostly pin compatible with PIC32MX5XX/6XX/7XX devices; however, some pins are not. In particular, the VDD and VSS pins have been added and moved to different pins. In addition, I/O functions that were on fixed pins now will largely be on remappable pins.

**TABLE A-11: PACKAGE DIFFERENCES**

| PIC32MX5XX/6XX/7XX Feature | PIC32MZ EF Feature |
|---|---|
| **VCAP Pin** | |
| On PIC32MX devices, an external capacitor is required between a VCAP pin and GND, which provides a filtering capacitor for the internal voltage regulator. | On PIC32MZ EF devices, this requirement has been removed. |
| A low-ESR capacitor (typically 10 µF) is required on the VCAP pin. | No VCAP pin. |
| **VDD and VSS Pins** | |

| **PPS I/O Pins** | |
| All peripheral functions are fixed as to what pin upon which they operate. | Peripheral functions on PIC32MZ EF devices are now routed through a PPS module, which routes the signals to the desired pins. When migrating software, it is necessary to initialize the PPS I/O functions in order to get the signal to and from the correct pin.<br>PPS functionality for the following peripherals:<br>• CAN<br>• UART<br>• SPI (except SCK)<br>• Input Capture<br>• Output Compare<br>• External Interrupt (except INT0)<br>• Timer Clocks (except Timer1)<br>• Reference Clocks (except REFCLK2) |

# APPENDIX B: MIGRATING FROM PIC32MZ EC TO PIC32MZ EF

This appendix provides an overview of considerations for migrating from PIC32MZ EC devices to the PIC32MZ EF family of devices. The code developed for PIC32MZ EC devices can be ported to PIC32MZ EF devices after making the appropriate changes outlined in the following sections.

The PIC32MZ EF devices are similar to PIC32MZ EC devices, with many feature improvements and new capabilities.

## B.1 Oscillator and PLL Configuration

A number of new features have been added to the oscillator and PLL to enhance their ability to work with crystals and to change frequencies.

Oscillator Differences summarizes the differences (indicated by **Bold** type) between the family differences for the oscillator.

**TABLE B-1: OSCILLATOR DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| **Primary Oscillator Crystal Power** | |
| On PIC32MZ EC devices, the crystal HS POSC mode is only functional with crystals that have certain characteristics, such as very low ESR. | On PIC32MZ EF devices, some DEVCFG0 bits have been added to allow control over the strength of the oscillator and to add a kick start boost.<br>POSCBOOST (DEVCFG0<21>)<br>1 = Boost the kick start of the oscillator<br>0 = Normal start of the oscillator<br>POSCGAIN<1:0> (DEVCFG0<20:19>)<br>11 = 2x gain setting<br>10 = 1.5x gain setting<br>01 = 0.5x gain setting<br>00 = 1x gain setting<br>Note that the default for POSCGAIN (2x gain setting) may overdrive crystals and shorten their life. It is the responsibility of the designer to ensure crystals are operated properly. |
| **Secondary Oscillator Crystal Power** | |
| On PIC32MZ EC devices, the Secondary Oscillator (SOSC) is not functional. | On PIC32MZ EF devices, the Secondary Oscillator is now functional, and provides similar strength and kick start boost features as the POSC.<br>SOSCBOOST (DEVCFG0<18>)<br>1 = Boost the kick start of the oscillator<br>0 = Normal start of the oscillator<br>SOSCGAIN<1:0> (DEVCFG0<17:16>)<br>11 = 2x gain setting<br>10 = 1.5x gain setting<br>01 = 0.5x gain setting<br>00 = 1x gain setting<br>Note that the default for SOSCGAIN (2x gain setting) may overdrive crystals and shorten their life. It is the responsibility of the designer to ensure crystals are operated properly. |
| **Clock Status Bits** | |
| On PIC32MZ EC devices, the SOSCRDY bit (OSCCON<22>) indicates when the Secondary Oscillator is ready. There are no indications of other oscillator status. | A new register, CLKSTAT, has been added, which includes the SOSCRDY bit (CLKSTAT<4>). In addition, new status bits are available:<br>• LPRCRDY (CLKSTAT<5>)<br>• POSCRDY (CLKSTAT<2>)<br>• DIVSPLLRDY (CLKSTAT<1>)<br>• FRCRDY (CLKSTAT<0>) |
| **Clock Switching** | |
| On PIC32MZ EC devices, clock switches occur as soon as the switch command is issued. Also, the only clock sources that can be divided are the output of the PLL, and the FRC. | To reduce power spikes during clock switches, PIC32MZ EF devices add a clock slewing feature, so that clock switches can be controlled in their rate and size. The SLEWCON register controls this feature. The SLEWCON register also features a SYSCLK divider, so that all of the possible clock sources may be divided further as needed. |

## B.2 Analog-to-Digital Converter (ADC)

The PIC32MZ EC family features a Pipelined ADC module, while the PIC32MZ EF family of devices has an entirely new 12-bit High-Speed SAR ADC module. Nearly all registers in this new ADC module differ from the registers in PIC32MZ EC devices. Due to this difference, code will not port from PIC32MZ EC devices to PIC32MZ EF devices. ADC Differences lists some of the differences in registers to note to adapt code as quickly as possible.

**TABLE B-2: ADC DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| **Clock Selection and Operating Frequency (TAD)** | |
| On PIC32MZ EC devices, there are three possible sources of the ADC clock: FRC, REFCLKO3, and SYSCLK.<br><br>ADCSEL<1:0> (AD1CON1<9:8>)<br>11 = FRC<br>10 = REFCLKO3<br>01 = SYSCLK<br>00 = Reserved | On PIC32MZ EF devices, there are four sources for the ADC clock. In addition to the ones for PIC32MZ EC, PBCLK4 is added as a source. Also, the clock source selection is in a different register.<br><br>ADCSEL<1:0> (ADCCON3<31:30>)<br>11 = FRC<br>10 = REFCLKO3<br>01 = SYSCLK<br>**00 = PBCLK4** |
| **Scan Trigger Sources** | |
| On PIC32MZ EC devices, there are 10 available trigger sources for starting ADC sampling and conversion.<br><br>STRGSRC<4:0> (AD1CON1<26:22>)<br>11111 = Reserved<br>•<br>•<br>•<br>01101 = Reserved<br>01100 = Comparator 2 COUT<br>01011 = Comparator 1 COUT<br>01010 = OCMP5<br>01001 = OCMP3<br>01000 = OCMP1<br>00111 = TMR5 match<br>00110 = TMR3 match<br>00101 = TMR1 match<br>00100 = INT0<br>**00011 = Reserved**<br>**00010 = Reserved**<br>00001 = Global Software Trigger (GSWTRG)<br>00000 = No trigger | On PIC32MZ EF devices, two new sources have been added. One is a shared trigger source (STRIG). The other is a Global Level Software Trigger (GLSWTRG). With the GLSWTRG, the conversions continue until the bit is cleared in software.<br><br>TRGSRC<4:0> (ADCTRGx<y:z>)<br>11111 = Reserved<br>•<br>•<br>•<br>01101 = Reserved<br>01100 = Comparator 2 COUT<br>01011 = Comparator 1 COUT<br>01010 = OCMP5<br>01001 = OCMP3<br>01000 = OCMP1<br>00111 = TMR5 match<br>00110 = TMR3 match<br>00101 = TMR1 match<br>00100 = INT0<br>**00011 = STRIG**<br>**00010 = Global Level Software Trigger (GLSWTRG)**<br>00001 = Global Software Trigger (GSWTRG)<br>00000 = No trigger |
| **Debug Mode** | |
| On PIC32MZ EC devices, the ADC module continues operating when stopping on a breakpoint during debugging. | On PIC32MZ EF devices, the ADC module will stop during debugging when stopping on a breakpoint. |
| **Electrical Specifications and Timing Requirements** | |
| Refer to the **"Electrical Characteristics"** chapter in the PIC32MZ EC data sheet for ADC module specifications and timing requirements. | On PIC32MZ EF devices, the ADC module sampling and conversion time and other specifications have changed. Refer to **37.0 "Electrical Characteristics"** for more information. |
| **ADC Calibration** | |

© 2015-2018 Microchip Technology Inc.

**TABLE B-2: ADC DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| PIC32MZ EC devices require calibration values be copied into the AD1CALx registers before turning on the ADC. These values come from the DEVADCx registers. | PIC32MZ EF devices also require ADC calibration values, but the destination registers are named ADCxCAL. |

## B.3 CPU

The CPU in PIC32MZ EC devices is the microAptiv™ MPU architecture. The CPU in the PIC32MZ EF devices is the Series 5 Warrior M-Class M5150 MPU architecture. Most PIC32MZ EF M-Class core features are identical to the microAptiv™ core in PIC32MZ EC devices. The main differences are that in PIC32MZ EF devices, a floating-point unit (FPU) is included for improved math performance, and PC Sampling for performance measurement.

## B.4 System Bus

The system bus on PIC32MZ EF devices is similar to the system bus on PIC32MZ EC devices. There are two key differences listed in System Bus Differences.

**TABLE B-3: SYSTEM BUS DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| **Permission Groups during NMI** | |
| On PIC32MZ EC devices, the permission group in which the CPU is part of is lost during NMI handling, and must be manually restored. | On PIC32MZ EF devices, the prior permission group is preserved, and is restored when the CPU returns from the NMI handler. |
| **DMA Access** | |
| The DMA can access the peripheral registers on Peripheral Bus 1. | On PIC32MZ EF devices, the DMA no longer has access to registers on Peripheral Bus 1. Refer to Initiators to Targets Access Association for details on which peripherals are now excluded. |

## B.5 Flash Controller

The Flash controller on PIC32MZ EF devices adds the ability both to control boot Flash aliasing, and for locking the current swap settings. Flash Controller Differences lists theses differences.

**TABLE B-4: FLASH CONTROLLER DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| **Boot Flash Aliasing** | |
| On PIC32MZ EC devices, Boot Flash aliasing is done through the DEVSEQ0 register, but no further changes are possible without rebooting the processor. | On PIC32MZ EF devices, the initial Boot Flash aliasing is determined by the DEVSEQ3 register, but the BFSWAP bit (NVMCON<6>) reflects the state of the aliasing, and can be modified to change it during run-time.<br><br>BFSWAP (NVMCON<6>)<br>1 = Boot Flash Bank 2 is mapped to the lower boot alias, and Boot Flash bank 1 is mapped to the upper boot alias<br>0 = Boot Flash Bank 1 is mapped to the lower boot alias, and Boot Flash Bank 2 is mapped to the upper boot alias |
| **PFM and BFM Swap Locking** | |
| On PIC32MZ EC devices, the swapping of PFM is always available. | On PIC32MZ EF devices, a new control, SWAPLOCK<1:0> (NVMCON2<7:6>) allows the locking of PFSWAP and BFSWAP bits, and can restrict any further changes.<br><br>SWAPLOCK<1:0> (NVMCON2<7:6>)<br>11 = PFSWAP and BFSWAP are not writable and SWAPLOCK is not writable<br>10 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable<br>01 = PFSWAP and BFSWAP are not writable and SWAPLOCK is writable<br>00 = PFSWAP and BFSWAP are writable and SWAPLOCK is writable |

© 2015-2018 Microchip Technology Inc.

## B.6 Resets

On PIC32MZ EF devices, the Reset module adds eight bits to the NMICNT field to make the time-out period before device Reset longer, as described in Resets Differences.

**TABLE B-5: RESETS DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| **Countdown to Reset During NMIs** | |
| On PIC32MZ EC devices, the NMICNT<7:0> field is eight bits long, giving a maximum of 256 instructions before the device Reset. | On PIC32MZ EF devices, the NMICNT<15:0> field is now 16 bits long, giving a longer period of time (up to 65,536 instructions) prior to a device Reset. |

## B.7 USB

On PIC32MZ EF devices, a new USBCRCON register has been added to assist in controlling the reset of the USB module, and triggering interrupts based on VBUS voltage levels. This register also overcomes an errata on PIC32MZ EC devices that requires a three second start-up on the USB module.

## B.8 I/O Ports

On PIC32MZ EF devices, many of the I/O pins now feature slew rate control bits to control how fast the pin makes a low-to-high or high-to-low transition. The Change Notification feature has also been enhanced to allow detection of level events in addition to edge detection. However, the SIDL bit is not present in the CNCONx registers on PIC32MZ EF devices, as it is on PIC32MZ EC devices.

## B.9 Watchdog Timer

PIC32MZ EF devices use a new Watchdog Timer, although the overall control through the DEVCFGx words remains identical to that of PIC32MZ EC devices. Watchdog Timer Differences lists two more changes, as well.

**TABLE B-6: WATCHDOG TIMER DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| **Watchdog Timer Postscaler** | |
| On PIC32MZ EC devices, the SWDTPS<4:0> bits (WDTCON<6:2>) reflect the postscaler setting for the Watchdog Timer. | On PIC32MZ EF devices, the field has been changed to the RUNDIV<4:0> bits (WDTCON<12:8>). |
| **Watchdog Windowed Mode** | |
| On PIC32MZ EC devices, WDTWINEN is at bit position 1 (WDTCON<1>). | On PIC32MZ EF devices, WDTWINEN is now at bit position 0 (WDTCON<0>). |

## B.10 Serial Quad Interface (SQI)

On PIC32MZ EF devices, the SQI module has been updated with the following features:

- FIFOs can be reset through the CONFIFORST (SQI1CFG<19>), RXFIFORST (SQI1CFG<18>), and TXFIFORST (SQI1CFG<17>) bits in Register 20-3
- A new Flash Status check is available, which will allow the SQI to automatically query the status of the external device during write/erase operations without software intervention. See the SCHECK bit (SQI1CON<24>) and the SQI1MEMSTAT register (Register 20-4 and Register 20-24, respectively).
- The SQI clock divider bits have been expanded, and can use an undivided clock. See the CLKDIV<10:0> bits (SQI1CLKCON<18:8>) in Register 20-5.
- A new DMA Bus Error Interrupt is available through the DMAEIE (SQI1INTEN<11>), DMAEIF (SQI1INTSTAT<11>), and DMAEISE (SQI1INTSIGEN<11>) bits in Register 20-8, Register 20-9, and Register 20-22, respectively
- The SQI1STAT2 register (see Register 20-13) has two new fields:
  - CMDSTAT<1:0> (SQI1STAT2<17:16>) indicates the current command status
  - CONAVAIL<4:0> (SQI1STAT<11:8>) indicates how many spaces are available in the Control FIFO.
- The TAP Controller within the SQI can be configured for various timing requirements via the SQI1TAPCON register (Register 20-23)
- Two new XIP mode registers (SQI1XCON3 and SQI1XCON4) have been added for additional command sequencing (see Register 20-25 and Register 20-26, respectively)

Refer to **20.0 “Serial Quad Interface (SQI)”** and **Section 46. “Serial Quad Interface (SQI)”** (DS60001128) for more information.

## B.11 PMP

On PIC32MZ EF devices, the PMP features the ability to buffer reads and writes in both directions, and can read and write from different addresses. Refer to **23.0 “Parallel Master Port (PMP)”** and **Section 43. “Parallel Master Port”** (DS60001346) for information.

## B.12 Crypto Engine

Crypto Differences lists the changes available for the Crypto Engine.

**TABLE B-7: CRYPTO DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |
|---|---|
| **Output Data Format** | |
| On PIC32MZ EC devices, the output of the Crypto Engine is always in big-endian format, usually requiring a software (or DMA) solution to put the data into little-endian format, which the core handles natively. | On PIC32MZ EF devices, the SWAPOEN bit (CECON<7>) has been added to control output byte swapping. This bit, when enabled, will byte-swap the output. |

## B.13 Device Configuration and Control

A number of enhancements have been added to the PIC32MZ EF devices that allow greater control and flexibility on the device. Some bit fields have also changed location. Device Configuration and Control Differences lists these changes.

**TABLE B-8: DEVICE CONFIGURATION AND CONTROL DIFFERENCES**

| PIC32MZ EC Feature | PIC32MZ EF Feature |

| **Boot Flash Sequence Control** | |
| On PIC32MZ EC devices, the Boot Flash Sequence (specifying which boot memory was mapped to the lower boot alias) was determined with the BFxSEQ0 registers. | On PIC32MZ EF devices, the Boot Flash Sequence has been moved to the BFxSEQ3 register. |

# APPENDIX C: REVISION HISTORY

## Revision A (January 2015)

This is the initial released version of the document.

## Revision B (July 2015)

The document status was updated from Advance Information to Preliminary.

The revision includes the following major changes, which are referenced by their respective chapter in Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

**TABLE C-1: MAJOR SECTION UPDATES**

| Section Name | Update Description |
|---|---|
| **32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog** | The Operating Conditions were updated to: 2.1V to 3.6V. |
| **4.0 “Memory Organization”** | Legal information on the System Bus was added (see **4.2 “System Bus Arbitration”**). |
| **5.0 “Flash Program Memory”** | The BOOTSWAP bit in the NVMCON register was changed to: BFSWAP (see Register 5-1). |
| **6.0 “Resets”** | The NVMLTA bit was removed from the RCON register (see Register 6-1).<br>The GNMI bit was added to the RNMICON register (see Register 6-3). |
| **7.0 “CPU Exceptions and Interrupt Controller”** | The ADC FIFO Data Ready Interrupt, IRQ 45, was added (see Table 7-2).<br>ADC FIFO bits were added, and Note 7 regarding devices without a Crypto module was added to the Interrupt Register Map (see Table 7-3).<br>The NMIKEY<7:0> bits were added to the INTCON register (see Register 7-1). |
| **8.0 “Oscillator Configuration”** | The SPLLRDY bit was removed and the SPLLDIVRDY bit was added to the CLKSTAT register (see Register 8-8 |
| **11.0 “Hi-Speed USB with On-The-Go (OTG)”** | The VBUSIE and VBUSIF bits were changed to: VBUSERRIE and VBUSERRIF, respectively in the USBCSR2 register (see Register 11-3). |
| **15.0 “Deadman Timer (DMT)”** | The POR values were updated for the PSCNT<4:0> bits in the Post Status Configure DMT Count Status register (see Register 15-6).<br>The POR values were updated for the PSINTV<2:0> bits in the Post Status Configure DMT Interval Status register (see Register 15-7). |
| **16.0 “Watchdog Timer (WDT)”** | The WDTCON register was updated (see Register 16-1). |
| **23.0 “Parallel Master Port (PMP)”** | The PMDOUT, PMDIN, and PMRDIN registers were added (see Register 23-4, Register 23-4, and Register 23-10).<br>The PMADDR, PMWADDR, and PMRADDR registers were updated (see Register 23-3, Register 23-8, and Register 23-9).<br>The PMRDATA register was removed. |
| **24.0 “External Bus Interface (EBI)”** | Reset values for the EBIMSK2, EBIMSK3, EBISMT0-EBISMT2, and EBIFTRPD registers were updated in the EBI Register Map (see Table 24-2).<br>POR value changes were implemented to the EBI Static Memory Timing Register (see Register 24-3). |

| **37.0 "Electrical Characteristics"** | The DC Characteristics: Operating Current ($I_{DD}$) and Note 6 were updated (see Table 37-6).<br>The DC Characteristics: Idle Current ($I_{IDLE}$) and Note 4 were updated (see Table 37-7).<br>Parameter DC40m and Note 5 in the DC Characteristics: Power-down Current ($I_{PD}$) were updated (see Table 37-8).<br>Parameter DO50 (Cosco) was removed from the Capacitive Loading Requirements on Output Pins (see Table 37-16).<br>The Internal FRC Accuracy and Internal LPRC conditions were updated for 125ºC (see Table 37-20 and Table 37-21).<br>Parameter SP15 and Note 5 of the SPIx Module Master Mode Timing Requirements were updated (see Table 37-30 and Table 37-31).<br>The Temperature Sensor Specifications were updated (see Table 37-41). |
| **38.0 "Extended Temperature Electrical Characteristics"** | New chapter for Extended Temperature devices was added. |
| **39.0 "AC and DC Characteristics Graphs"** | The Typical Temperature Sensor Voltage graph was updated (see Figure 39-7). |
| **40.0 "Packaging Information"** | The package drawings and land pattern for the 64-Lead Plastic Quad Flat, No Lead Package (MR) were updated. |
| **Appendix A: "Migrating from PIC32MX5XX/6XX/7XX to PIC32MZ EF"** | The Primary Oscillator Configuration section in the Oscillator Configuration Differences was updated (see Table A-1). |
| **Appendix B: "Migrating from PIC32MZ EC to PIC32MZ EF"** | Boot Flashing aliasing was updated for PIC32MZ EF devices (see Table B-4). |

## Revision D (July 2016)

This revision includes the following major changes, which are referenced by their respective chapter in Major Section Updates.

In addition, minor updates to text and formatting were incorporated throughout the document.

**TABLE C-3: MAJOR SECTION UPDATES**

| Section Name | Update Description |
|---|---|
| **32-bit MCUs (up to 2 MB Live-Update Flash and 512 KB SRAM) with FPU, Audio and Graphics Interfaces, HS USB, Ethernet, and Advanced Analog** | Updated the Operating Conditions and Core MHz values.<br>The XFBGA package was renamed to TFBGA. |
| **20.0 "Serial Quad Interface (SQI)"** | The CLKDIV<9:0> bits in the SQI1CLKCON register were updated (see Register 20-5).<br>The THRES<4:0> bits in the SQI1THR register were updated (see Register 20-21). |
| **37.0 "Electrical Characteristics"** | The Program Flash Memory Wait States were updated (see DC Characteristics: Program Flash Memory Wait States).<br>The minimum value for System Time Requirements parameter OS51 (when the USB module is enabled) was updated (see System Timing Requirements). |
| **39.0 "252 MHz electrical characteristics"** | This chapter was added. |
| **Appendix A: "Migrating from PIC32MX5XX/6XX/7XX to PIC32MZ EF"** | The new ADC module reference was updated (see **A.2 "Analog-to-Digital Converter (ADC)"**).<br>ADC Calibration was added to **B.2 "Analog-to-Digital Converter (ADC)"** |
| **Appendix B: "Migrating from PIC32MZ EC to PIC32MZ EF"** | The Device Configuration and Control Differences (Device Configuration and Control Differences) were updated to include the Boot Flash Sequence.<br>**B.10 "Serial Quad Interface (SQI)"** was updated. |
| **Product Identification System** | The Speed category was added. |

## Revision E (June 2018)

This revision includes the following major changes, which are referenced by their respective chapter in Table C-4.

In addition, minor updates to text and formatting were incorporated throughout the document.

**TABLE C-4: MAJOR SECTION UPDATES**

| Section Name | Update Description |
|---|---|
| **TABLE 1: "PIC32MZ EF Family Features"** | 144-Lead TFBGA package information was added |
| **TABLE 6: "Pin Names for 144-pin Devices"** | Table was added to describe the Pin Names and locations for the 144-Lead TFBGA package. |
| **TABLE 1-1: "ADC Pinout I/O Descriptions"** through **Table 1-22: "JTAG, Trace, and Programming/Debugging Pinout I/O Descriptions"** | 144-Lead TFBGA Package Information was added. |
| **2.11 "Considerations when Interfacing to Remotely Powered Circuits"** | This section was added which provides some issues to consider when interfacing the PIC32MZ to circuits using an independent power source. |
| **28.0 "12-bit High-Speed Successive Approximation Register (SAR) Analog-to-Digital Converter (ADC)"** | Information relating to initialization and interleaved operation and charge pump usage are added to aid in throughput calculation. |
| **Register 34-10: "CFGPG: Permission Group Configuration Register"** | A note was added to provide assistance in setting the CPU group permission value. |
| **37.1 "DC Characteristics"** | 144-Lead TFBGA package thermal information was added. |
| **41.0 "Packaging Information"** | 144-Lead TFBGA package information was added. |
| **Product Identification System** | 144-Lead TFBGA package thermal information was added. |

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

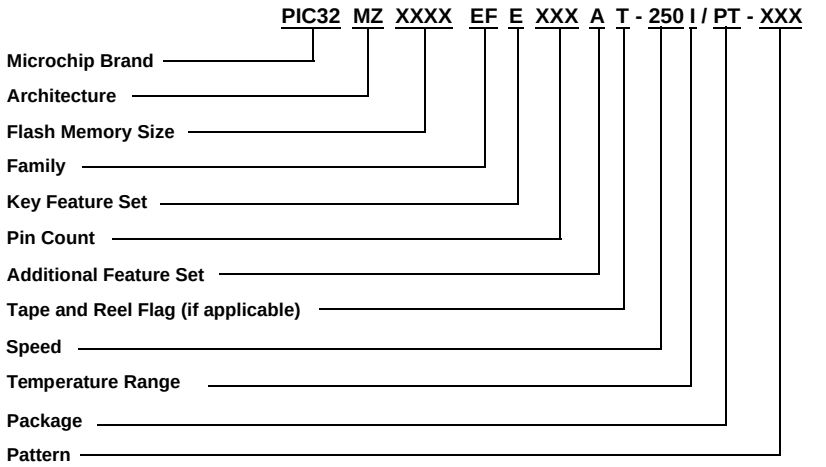

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

**Technical support is available through the web site at: http://microchip.com/support**

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

**Example:**

PIC32MZ2048EFH144-I/PT:
Embedded Connectivity PIC32,
MIPS32® M-Class MPU core,
2048 KB program memory,
144-pin, with Floating Point Unit,
Industrial temperature, TQFP package.

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

*Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
