

Product Change Notification / SYST-07NXZF823

Date:

08-Apr-2022

Product Category:

Real-Time Clock/Calendar

PCN Type:

Document Change

Notification Subject:

Data Sheet - MCP7940N Battery-Backed I2C Real-Time Clock/Calendar with SRAM

Affected CPNs:

[SYST-07NXZF823_Affected_CPN_04082022.pdf](#)

[SYST-07NXZF823_Affected_CPN_04082022.csv](#)

Notification Text:

SYST-07NXZF823

Microchip has released a new Product Documents for the MCP7940N Battery-Backed I2C Real-Time Clock/Calendar with SRAM of devices. If you are using one of these devices please read the document located at [MCP7940N Battery-Backed I2C Real-Time Clock/Calendar with SRAM](#).

Notification Status: Final

Description of Change:

- Updated Data Sheet for MCP7940N I2C RTCC to include Automotive part numbers and other fixes.
- Updated SOIC, TDFN and TSSOP package drawings.
- Replaced terminology "Master" and "Slave" with "Host" and "Client" respectively.

Impacts to Data Sheet: None

Reason for Change: To Improve Productivity

Change Implementation Status: Complete

Date Document Changes Effective: 08 Apr 2022

NOTE: Please be advised that this is a change to the document only the product has not been changed.

Markings to Distinguish Revised from Unrevised Devices: N/A

Attachments:

Please contact your local [Microchip sales office](#) with questions or concerns regarding this notification.

Terms and Conditions:

If you wish to receive Microchip PCNs via email please register for our PCN email service at our [PCN home page](#) select register then fill in the required fields. You will find instructions about registering for Microchips PCN email service in the [PCN FAQ](#) section.

If you wish to change your PCN profile, including opt out, please go to the [PCN home page](#) select login and sign into your myMicrochip account. Select a profile option from the left navigation bar and make the applicable selections.

Battery-Backed I²C Real-Time Clock/Calendar with SRAM

Timekeeping Features

- Real-Time Clock/Calendar (RTCC):
 - Hours, Minutes, Seconds, Day of Week, Day, Month, Year
 - Leap year compensated to 2399
 - 12/24 hour modes
- Oscillator for 32.768 kHz Crystals:
 - Optimized for 6-9 pF crystals
- On-Chip Digital Trimming/Calibration:
 - ±1 PPM resolution
 - ±129 PPM range
- Dual Programmable Alarms
- Versatile Output Pin:
 - Clock output with selectable frequency
 - Alarm output
 - General purpose output
- Power-Fail Time-Stamp:
 - Time logged on switchover to and from Battery mode

Low-Power Features

- Wide Voltage Range:
 - Operating voltage range of 1.8V to 5.5V
 - Backup voltage range of 1.3V to 5.5V
- Low Typical Timekeeping Current:
 - Operating from V_{CC}: 1.2 µA at 3.3V
 - Operating from battery backup: 925 nA at 3.0V
- Automatic Switchover to Battery Backup

User Memory

- 64-byte Battery-Backed SRAM

Operating Ranges

- Two-Wire Serial Interface, I²C Compatible
 - I²C clock rate up to 400 kHz
- Temperature Range:
 - Industrial (I): -40°C to +85°C
 - Extended (E): -40°C to +125°C
- Automotive AEC-Q100 Qualified

Packages

- 8-Lead MSOP, 8-Lead PDIP, 8-Lead SOIC, 8-Lead 2x3 TDFN and 8-Lead TSSOP

General Description

The MCP7940N Real-Time Clock/Calendar (RTCC) tracks time using internal counters for hours, minutes, seconds, days, months, years, and day of week. Alarms can be configured on all counters up to and including months. For usage and configuration, the MCP7940N supports I²C communications up to 400 kHz.

The open-drain, multi-functional output can be configured to assert on an alarm match, to output a selectable frequency square wave, or as a general purpose output.

The MCP7940N is designed to operate using a 32.768 kHz tuning fork crystal with external crystal load capacitors. On-chip digital trimming can be used to adjust for frequency variance caused by crystal tolerance and temperature.

SRAM and timekeeping circuitry are powered from the back-up supply when main power is lost, allowing the device to maintain accurate time and the SRAM contents. The times when the device switches over to the back-up supply and when primary power returns are both logged by the power-fail time-stamp.

Package Types

MCP7940N

FIGURE 1-1: TYPICAL APPLICATION SCHEMATIC

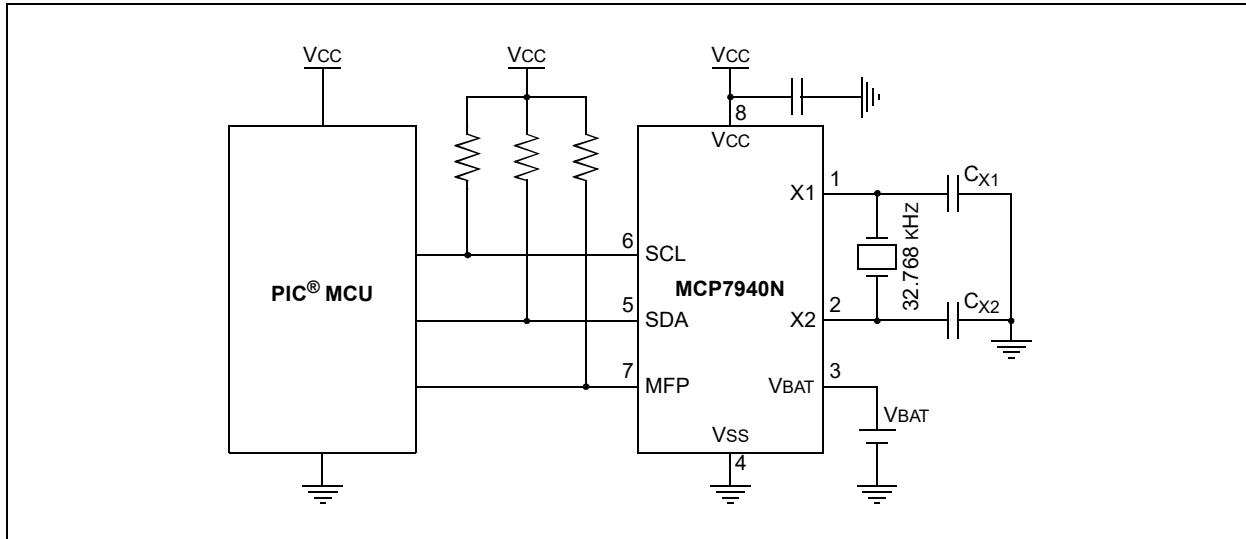

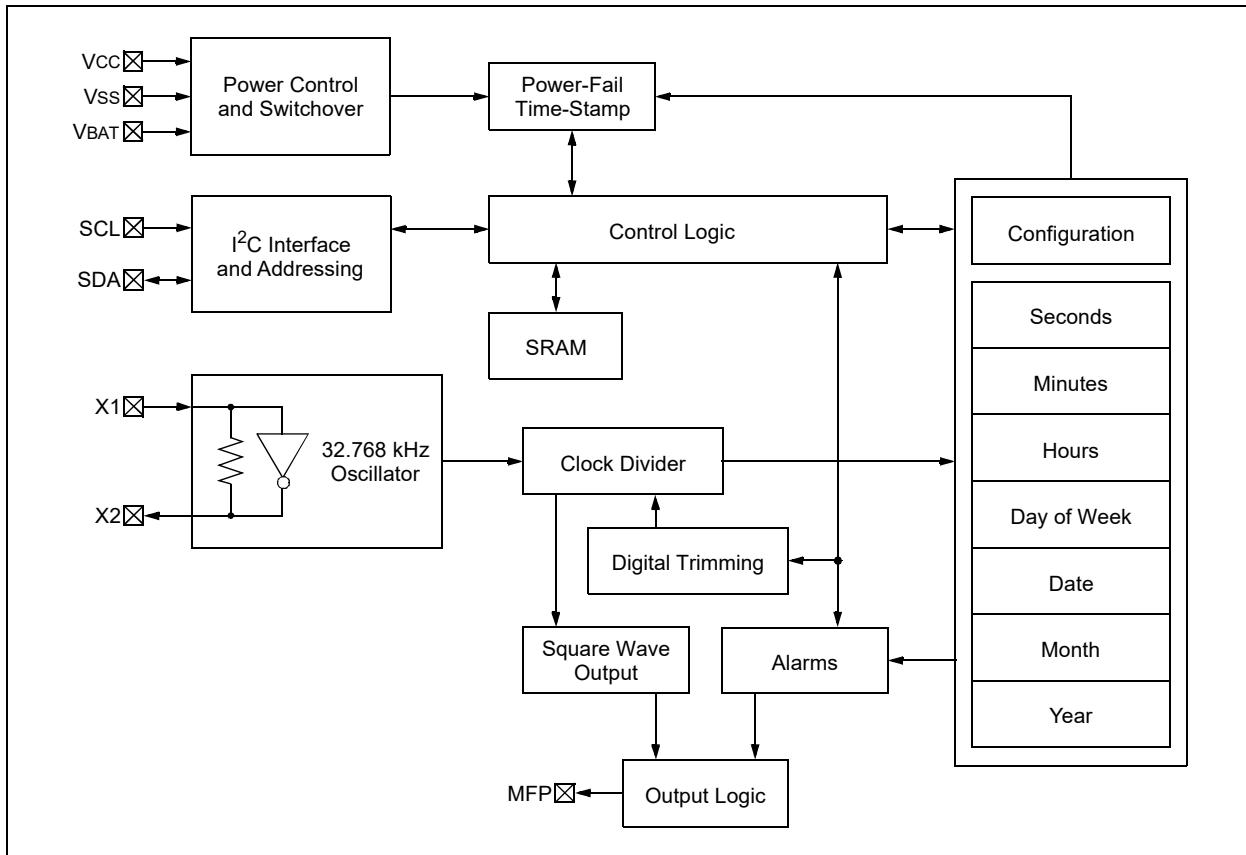

FIGURE 1-2: BLOCK DIAGRAM

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings (†)

V _{CC}	6.5V
All inputs and outputs (except SDA and SCL) w.r.t. V _{SS}	-0.6V to V _{CC} +1.0V
SDA and SCL w.r.t. V _{SS}	-0.6V to 6.5V
Storage temperature	-65°C to +150°C
Ambient temperature with power applied.....	-40°C to +125°C
ESD protection on all pins	≥ 4 kV

† **NOTICE:** Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 1-1: DC CHARACTERISTICS

DC CHARACTERISTICS			Industrial (I): V _{CC} = +1.8V to 5.5V		Extended (E): V _{CC} = +1.8V to 5.5V		TA = -40°C to +85°C

2.0 TYPICAL PERFORMANCE CURVE

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data represented may be outside the specified operating range (e.g., outside specified power supply range) and therefore, outside the warranted range.

MCP7940N

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

TABLE 3-1: PIN FUNCTION TABLE

Name	MSOP	PDIP	SOIC	TDFN	TSSOP	Function
X1	1	1	1	1	1	Quartz Crystal Input, External Oscillator Input
X2	2	2	2	2	2	Quartz Crystal Output
VBAT	3	3	3	3	3	Battery Backup Supply Input
Vss	4	4	4	4	4	Ground
SDA	5	5	5	5	5	Bidirectional Serial Data (I ² C)
SCL	6	6	6	6	6	Serial Clock (I ² C)
MFP	7	7	7	7	7	Multifunction Pin
Vcc	8	8	8	8	8	Primary Power Supply

Note: Exposed pad on TFDN can be connected to Vss or left floating.

3.1 Serial Data (SDA)

This is a bidirectional pin used to transfer addresses and data into and out of the device. It is an open-drain terminal. Therefore, the SDA bus requires a pull-up resistor to Vcc (typically 10 k Ω for 100 kHz, 2 k Ω for 400 kHz). For normal data transfer, SDA is allowed to change only during SCL low. Changes during SCL high are reserved for indicating the Start and Stop conditions.

3.2 Serial Clock (SCL)

This input is used to synchronize the data transfer to and from the device.

3.3 Oscillator Input/Output (X1, X2)

These pins are used as the connections for an external 32.768 kHz quartz crystal and load capacitors. X1 is the crystal oscillator input and X2 is the output. The MCP7940N is designed to allow for the use of external load capacitors in order to provide additional flexibility when choosing external crystals. The MCP7940N is optimized for crystals with a specified load capacitance of 6-9 pF.

X1 also serves as the external clock input when the MCP7940N is configured to use an external oscillator.

3.4 Multifunction Pin (MFP)

This is an output pin used for the alarm and square wave output functions. It can also serve as a general purpose output pin by controlling the OUT bit in the CONTROL register.

The MFP is an open-drain output and requires a pull-up resistor to Vcc (typically 10 k Ω). This pin may be left floating if not used.

3.5 Backup Supply (VBAT)

This is the input for a backup supply to maintain the RTCC and SRAM registers during the time when Vcc is unavailable.

If the battery backup feature is not being used, the VBAT pin should be connected to Vss.

4.0 I²C BUS CHARACTERISTICS

4.1 I²C Interface

The MCP7940N supports a bidirectional two-wire bus and data transmission protocol. A device that sends data onto the bus is defined as transmitter, and a device receiving data as receiver. The bus has to be controlled by a host device which generates the Start and Stop conditions, while the MCP7940N works as client. Both host and client can operate as transmitter or receiver but the host device determines which mode is activated.

4.1.1 BUS CHARACTERISTICS

The following **bus protocol** has been defined:

- Data transfer may be initiated only when the bus is not busy.
- During data transfer, the data line must remain stable whenever the clock line is high. Changes in the data line while the clock line is high will be interpreted as a Start or Stop condition.

Accordingly, the following bus conditions have been defined (Figure 4-1).

4.1.1.1 Bus Not Busy (A)

Both data and clock lines remain high.

4.1.1.2 Start Data Transfer (B)

A high-to-low transition of the SDA line while the clock (SCL) is high determines a Start condition. All commands must be preceded by a Start condition.

4.1.1.3 Stop Data Transfer (C)

A low-to-high transition of the SDA line while the clock (SCL) is high determines a Stop condition. All operations must end with a Stop condition.

4.1.1.4 Data Valid (D)

The state of the data line represents valid data when, after a Start condition, the data line is stable for the duration of the high period of the clock signal.

The data on the line must be changed during the low period of the clock signal. There is one bit of data per clock pulse.

Each data transfer is initiated with a Start condition and terminated with a Stop condition. The number of the data bytes transferred between the Start and Stop conditions is determined by the host device.

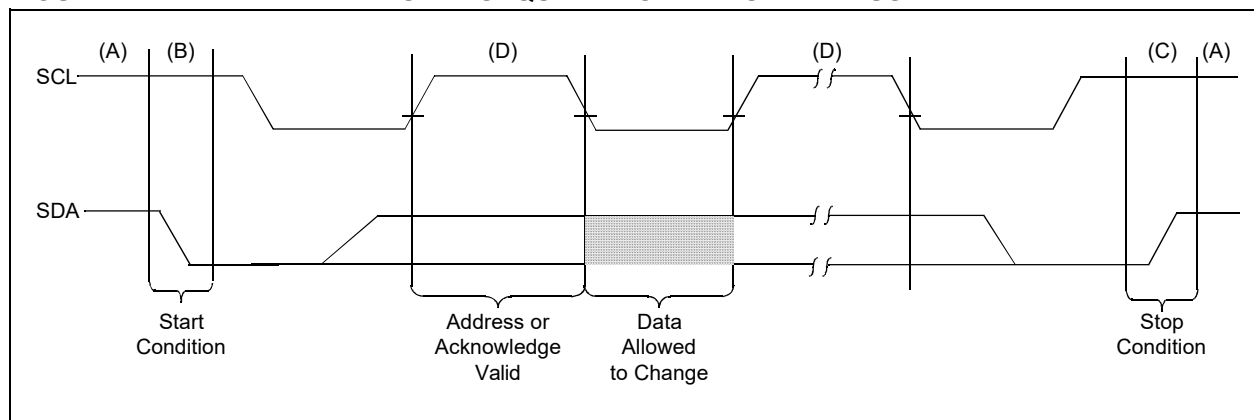

4.1.1.5 Acknowledge

Each receiving device, when addressed, is obliged to generate an Acknowledge signal after the reception of each byte. The host device must generate an extra clock pulse which is associated with this Acknowledge bit.

Note: The I²C interface is disabled while operating from the backup power supply.

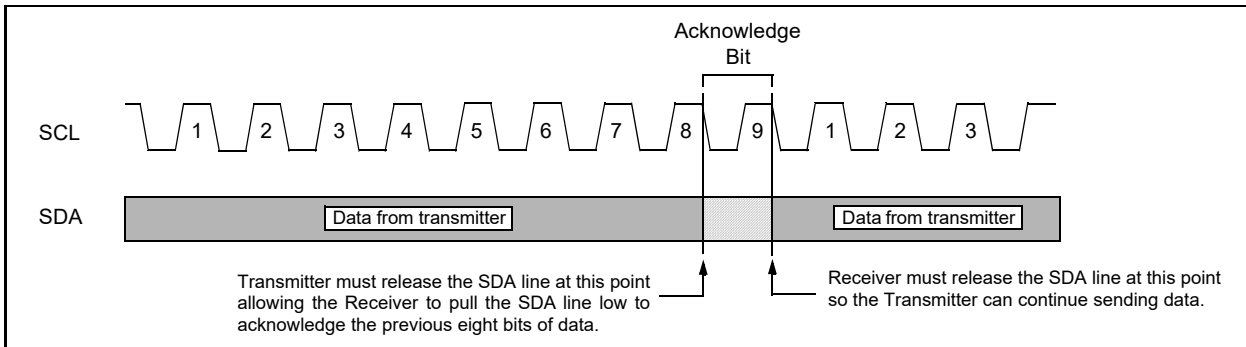

A device that acknowledges must pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable-low during the high period of the Acknowledge-related clock pulse. Of course, setup and hold times must be taken into account. During reads, a host must signal an end of data to the client by NOT generating an Acknowledge bit on the last byte that has been clocked out of the client. In this case, the client (MCP7940N) will leave the data line high to enable the host to generate the Stop condition.

FIGURE 4-1: DATA TRANSFER SEQUENCE ON THE SERIAL BUS

MCP7940N

FIGURE 4-2: ACKNOWLEDGE TIMING

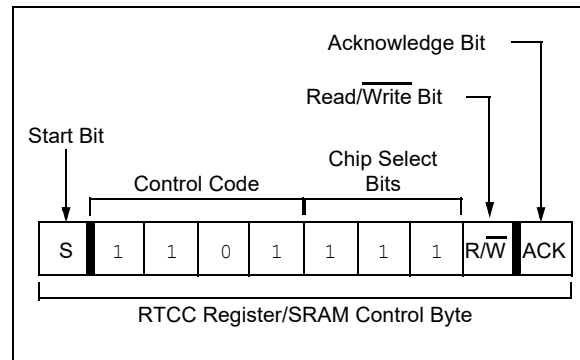

4.1.2 DEVICE ADDRESSING

The control byte is the first byte received following the Start condition from the host device (Figure 4-3). The control byte begins with a 4-bit control code. For the MCP7940N, this is set '1101' for register read and write operations. The next three bits are non-configurable Chip Select bits that must always be set to '1'.

The last bit of the control byte defines the operation to be performed. When set to a '1' a read operation is selected, and when set to a '0' a write operation is selected.

The combination of the 4-bit control code and the three Chip Select bits is called the client address. Upon receiving a valid client address, the client device outputs an acknowledge signal on the SDA line. Depending on the state of the R/W bit, the MCP7940N will select a read or a write operation.

FIGURE 4-3: CONTROL BYTE FORMAT

5.0 FUNCTIONAL DESCRIPTION

The MCP7940N is a highly-integrated Real-Time Clock/Calendar (RTCC). Using an on-board, low-power oscillator, the current time is maintained in seconds, minutes, hours, day of week, date, month, and year. The MCP7940N also features 64 bytes of general purpose SRAM. Two alarm modules allow interrupts to be generated at specific times with flexible comparison options. Digital trimming can be used to compensate for inaccuracies inherent with crystals. Using the backup supply input and an integrated power switch, the MCP7940N will automatically switch to backup power when primary power is unavailable, allowing the current time and the SRAM contents to be maintained. The time-stamp module captures the time when primary power is lost and when it is restored.

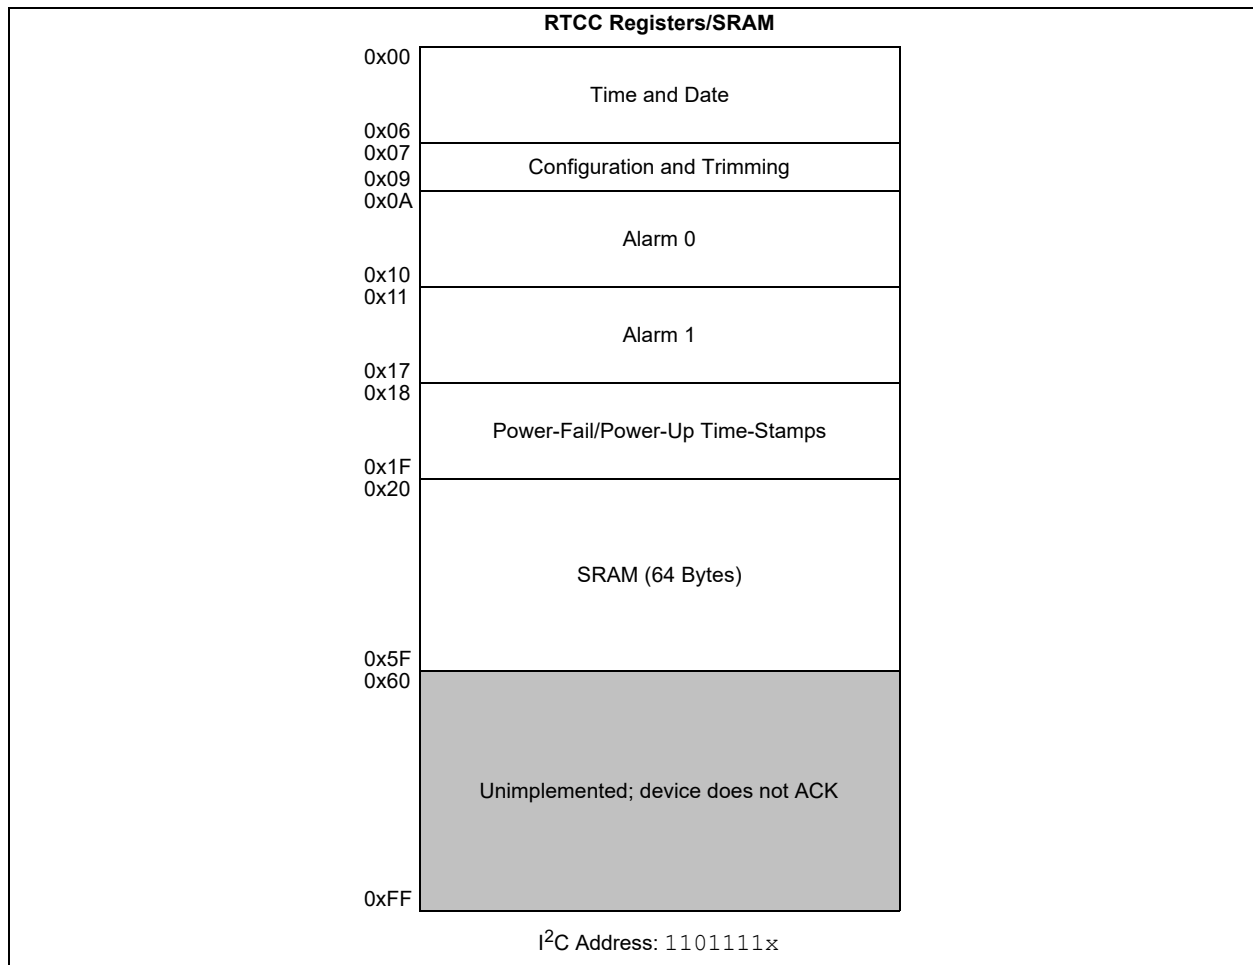

The RTCC configuration and Status registers are used to access all of the modules featured on the MCP7940N.

5.1 Memory Organization

The MCP7940N features two different blocks of memory: the RTCC registers and general purpose SRAM (Figure 5-1). They share the same address space, accessed through the '1101111x' control byte. Unused locations are not accessible. The MCP7940N will not acknowledge if the address is out of range, as shown in the shaded region of the memory map in Figure 5-1.

The RTCC registers are contained in addresses 0x00-0x1F. Table 5-1 shows the detailed RTCC register map. There are 64 bytes of user-accessible SRAM, located in the address range 0x20-0x5F. The SRAM is a separate block from the RTCC registers. All RTCC registers and SRAM locations are maintained while operating from backup power.

3: The ALMPOL bit in the ALM1WKDAY register is read-only and reflects the value of the ALMPOL bit in the ALM0WKDAY register.

5.2 Oscillator Configuration

The MCP7940N can be operated in two different oscillator configurations: using an external crystal or using an external clock input.

5.2.1 EXTERNAL CRYSTAL

The crystal oscillator circuit on the MCP7940N is designed to operate with a standard 32.768 kHz tuning fork crystal and matching external load capacitors. By using external load capacitors, the MCP7940N allows for a wide selection of crystals. Suitable crystals have a load capacitance (CL) of 6-9 pF. Crystals with a load capacitance of 12.5 pF are not recommended.

Figure 5-2 shows the pin connections when using an external crystal.

FIGURE 5-2: CRYSTAL OPERATION

Note 1: The ST bit must be set to enable the crystal oscillator circuit.

2: Always verify oscillator performance over the voltage and temperature range that is expected for the application.

5.2.1.1 Choosing Load Capacitors

CL is the effective load capacitance as seen by the crystal, and includes the physical load capacitors, pin capacitance, and stray board capacitance. Equation 5-1 can be used to calculate CL.

CX1 and CX2 are the external load capacitors. They must be chosen to match the selected crystal's specified load capacitance.

Note: If the load capacitance is not correctly matched to the chosen crystal's specified value, the crystal may give a frequency outside of the crystal manufacturer's specifications.

EQUATION 5-1: LOAD CAPACITANCE CALCULATION

$$C_L = \frac{C_{X1} \times C_{X2}}{C_{X1} + C_{X2}} + C_{STRAY}$$

Where:

CL = Effective load capacitance

CX1 = Capacitor value on X1 + COSC

CX2 = Capacitor value on X2 + COSC

CSTRAY = PCB stray capacitance

5.2.1.2 Layout Considerations

The oscillator circuit should be placed on the same side of the board as the device. Place the oscillator circuit close to the respective oscillator pins. The load capacitors should be placed next to the oscillator itself, on the same side of the board.

Use a grounded copper pour around the oscillator circuit to isolate it from surrounding circuits. The grounded copper pour should be routed directly to VSS. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed.

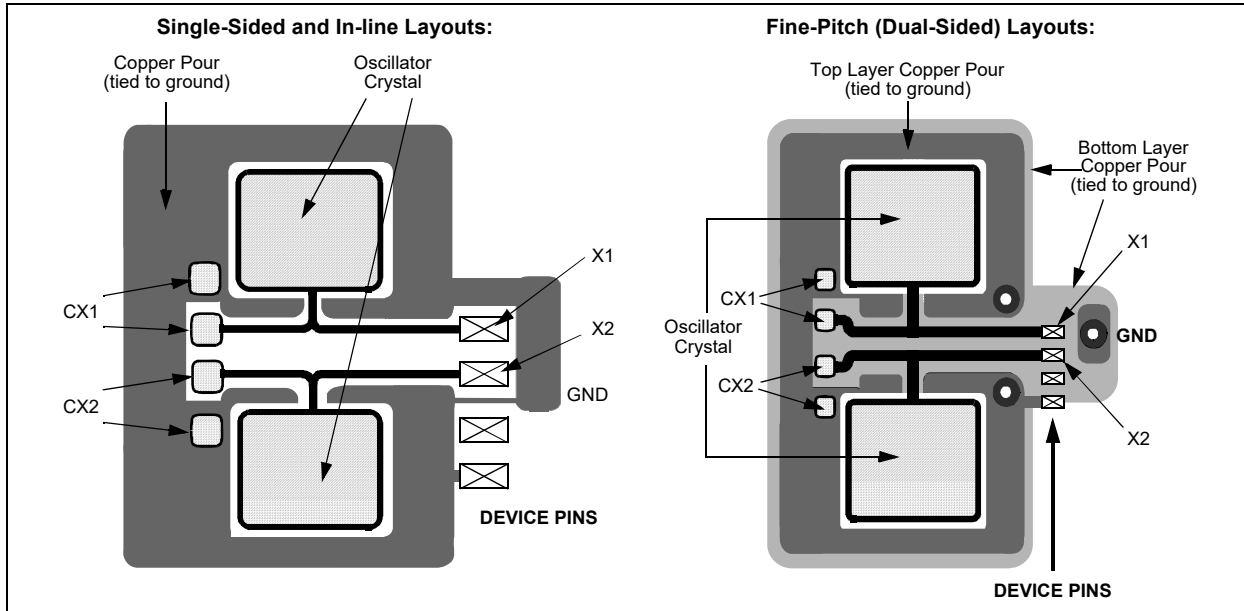

Layout suggestions are shown in Figure 5-3. In-line packages may be handled with a single-sided layout that completely encompasses the oscillator pins. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

For additional information and design guidance on oscillator circuits, refer to these Microchip Application Notes, available at the corporate website (www.microchip.com):

- AN1365, "Recommended Usage of Microchip Serial RTCC Devices"
- AN1519, "Recommended Crystals for Microchip Stand-Alone Real-Time Clock Calendar Devices"

FIGURE 5-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

5.2.2 EXTERNAL CLOCK INPUT

A 32.768 kHz external clock source can be connected to the X1 pin (Figure 5-4). When using this configuration, the X2 pin should be left floating.

Note: The EXTOSC bit must be set to enable an external clock source.

FIGURE 5-4: EXTERNAL CLOCK INPUT OPERATION

5.2.3 OSCILLATOR FAILURE STATUS

The MCP7940N features an oscillator failure flag, OSCRUN, that indicates whether or not the oscillator is running. The OSCRUN bit is automatically set after 32 oscillator cycles are detected. If no oscillator cycles are detected for more than TosF, then the OSCRUN bit is automatically cleared (Figure 5-5). This can occur if the oscillator is stopped by clearing the ST bit or due to oscillator failure.

FIGURE 5-5: OSCILLATOR FAILURE STATUS TIMING DIAGRAM

TABLE 5-2: SUMMARY OF REGISTERS ASSOCIATED WITH OSCILLATOR CONFIGURATION

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Register on Page

RTCWKDAY	—	—	OSCRUN	PWRFAIL	VBATEN	WKDAY2	WKDAY1	WKDAY0	18
CONTROL	OUT	SQWEN	ALM1EN	ALM0EN	EXTOSC	CRSTRIM	SQWFS1	SQWFS0	26

Legend: — = unimplemented location, read as '0'. Shaded cells are not used by oscillator configuration.

5.3 Timekeeping

The MCP7940N maintains the current time and date using an external 32.768 kHz crystal or clock source. Separate registers are used for tracking seconds, minutes, hours, day of week, date, month, and year. The MCP7940N automatically adjusts for months with less than 31 days and compensates for leap years from 2001 to 2399. The year is stored as a two-digit value.

Both 12-hour and 24-hour time formats are supported and are selected using the 12/24 bit.

The day of week value counts from 1 to 7, increments at midnight, and the representation is user-defined (i.e., the MCP7940N does not require 1 to equal Sunday, etc.).

All time and date values are stored in the registers as binary-coded decimal (BCD) values. The MCP7940N will continue to maintain the time and date while operating off the backup supply.

When reading from the timekeeping registers, the registers are buffered to prevent errors due to rollover of counters. The following events cause the buffers to be updated:

- When a read is initiated from the RTCC registers (addresses 0x00 to 0x1F)
- During an RTCC register read operation, when the register address rolls over from 0x1F to 0x00

The timekeeping registers should be read in a single operation to utilize the on-board buffers and avoid rollover issues.

Note 1: Loading invalid values into the time and date registers will result in undefined operation.

2: To avoid rollover issues when loading new time and date values, the oscillator/clock input should be disabled by clearing the ST bit for External Crystal mode and the EXTOSC bit for External Clock Input mode. After waiting for the OSCRUN bit to clear, the new values can be loaded and the ST or EXTOSC bit can then be re-enabled.

5.3.1 DIGIT CARRY RULES

The following list explains which timer values cause a digit carry when there is a rollover:

- Time of day: from 11:59:59 PM to 12:00:00 AM (12-hour mode) or 23:59:59 to 00:00:00 (24-hour mode), with a carry to the Date and Weekday fields
- Date: carries to the Month field according to Table 5-3
- Weekday: from 7 to 1 with no carry
- Month: from 12/31 to 01/01 with a carry to the Year field
- Year: from 99 to 00 with no carry

TABLE 5-3: DAY TO MONTH ROLLOVER SCHEDULE

Month	Name	Maximum Date
01	January	31
02	February	28 or 29 ⁽¹⁾
03	March	31
04	April	30
05	May	31
06	June	30
07	July	31
08	August	31
09	September	30
10	October	31
11	November	30
12	December	31

Note 1: 29 during leap years, otherwise 28.

MCP7940N

5.4 Alarms

The MCP7940N features two independent alarms. Each alarm can be used to either generate an interrupt at a specific time in the future, or to generate a periodic interrupt every minute, hour, day, day of week, or month.

There is a separate interrupt flag, ALMxIF, for each alarm. The interrupt flags are set by hardware when the chosen alarm mask condition matches (Table 5-5). The interrupt flags must be cleared in software.

If either alarm module is enabled by setting the corresponding ALMxEN bit in the CONTROL register, and if the square wave clock output is disabled (SQWEN = 0), then the MFP will operate in Alarm Interrupt Output mode. Refer to Section 5.5 “Output Configurations” for details. The alarm interrupt output is available while operating from the backup power supply.

Both Alarm0 and Alarm1 offer identical operation. All time and date values are stored in the registers as binary-coded decimal (BCD) values.

Note: Throughout this section, references to the register and bit names for the alarm modules are referred to generically by the use of ‘x’ in place of the specific module number. Thus, “ALMxSEC” might refer to the seconds register for Alarm0 or Alarm1.

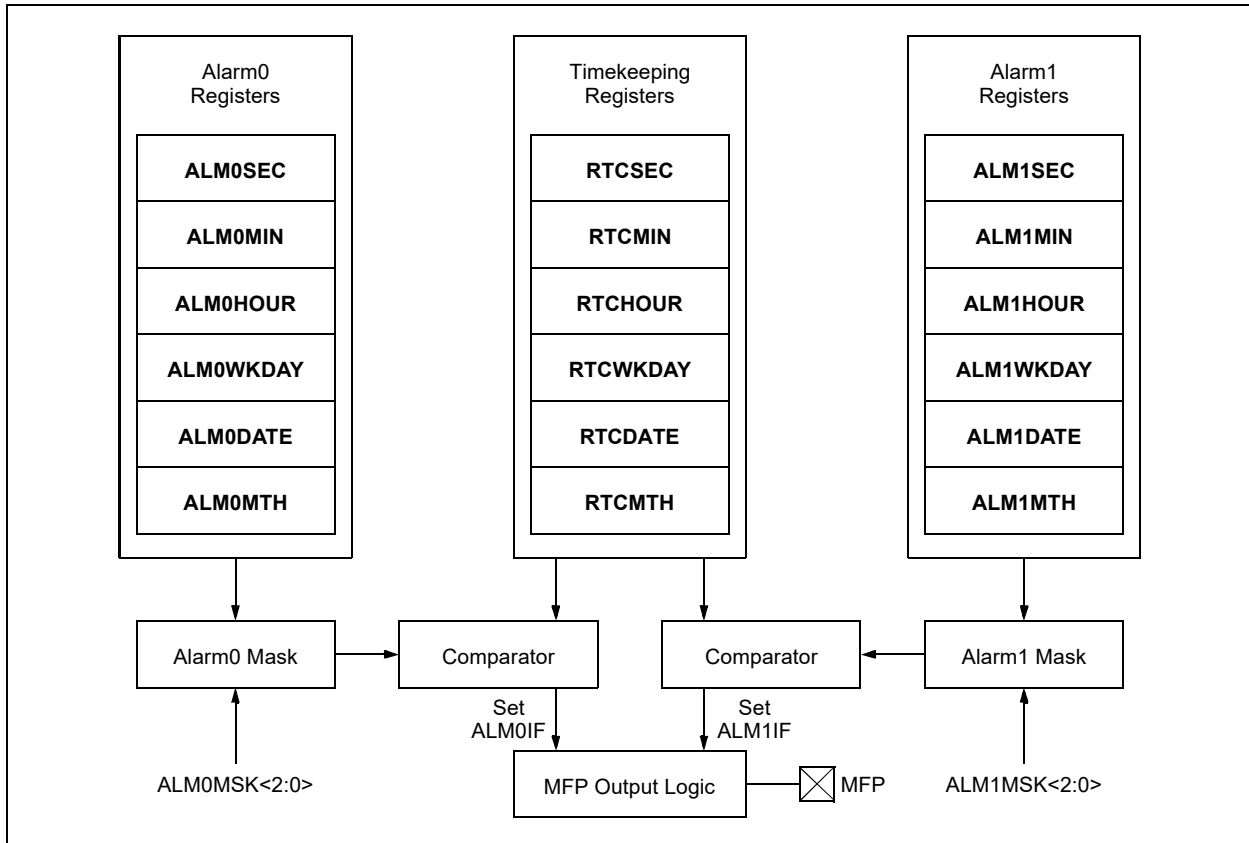

TABLE 5-5: ALARM MASKS

ALMxMSK<2:0>	Alarm Asserts on Match of
000	Seconds
001	Minutes
010	Hours
011	Day of Week
100	Date
101	Reserved
110	Reserved
111	Seconds, Minutes, Hours, Day of Week, Date, and Month

Note 1: The alarm interrupt flags must be cleared by the user. If a flag is cleared while the corresponding alarm condition still matches, the flag will be set again, generating another interrupt.

2: Loading invalid values into the alarm registers will result in undefined operation.

FIGURE 5-6: ALARM BLOCK DIAGRAM

5.4.1 CONFIGURING THE ALARM

In order to configure the alarm modules, the following steps need to be performed:

1. Load the timekeeping registers and enable the oscillator
2. Configure the ALMxMSK<2:0> bits to select the desired alarm mask
3. Set or clear the ALMPOL bit according to the desired output polarity
4. Ensure the ALMxIF flag is cleared
5. Based on the selected alarm mask, load the alarm match value into the appropriate register(s)
6. Enable the alarm module by setting the ALMxEN bit

5.5 Output Configurations

The MCP7940N features Square Wave Clock Output, Alarm Interrupt Output, and General Purpose Output modes. All of the output functions are multiplexed onto MFP according to Table 5-7.

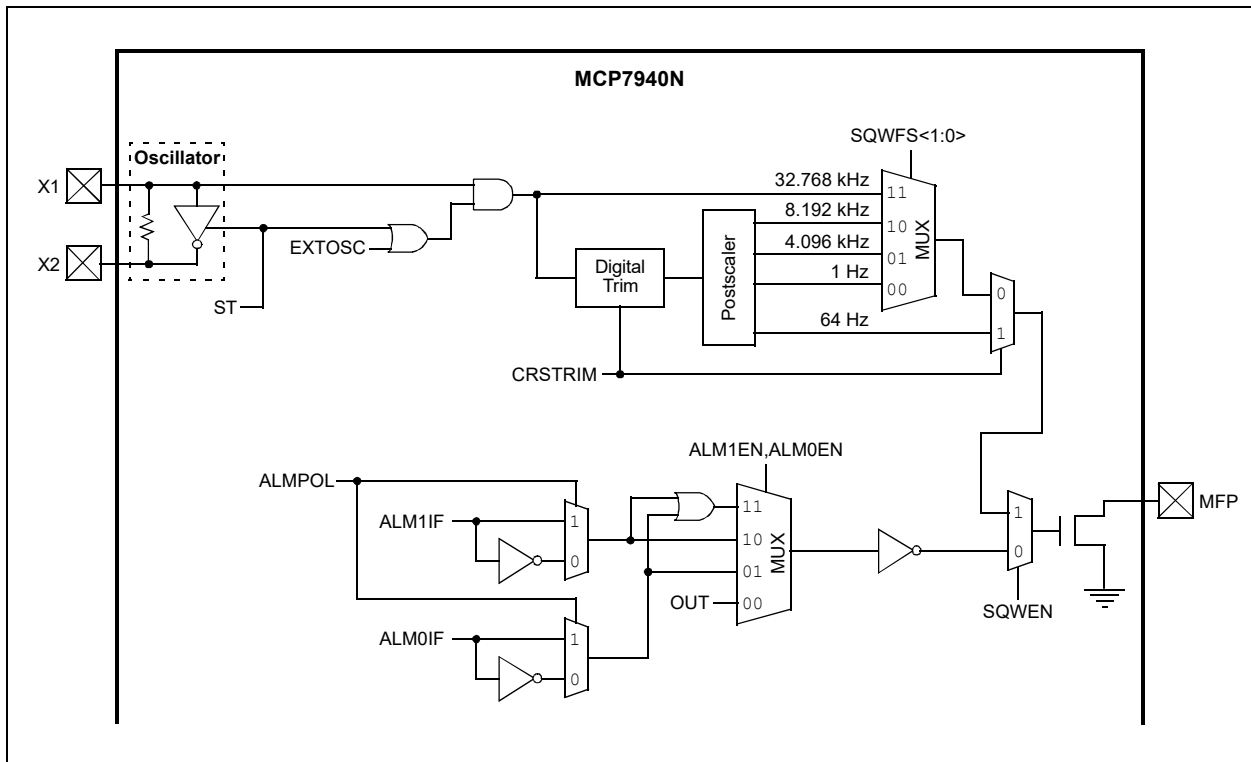

Only the alarm interrupt outputs are available while operating from the backup power supply. If none of the output functions are being used, the MFP can safely be left floating.

Note: The MFP is an open-drain output and requires a pull-up resistor to Vcc (typically 10 kΩ).

TABLE 5-7: MFP OUTPUT MODES

 1 = Enable X1 pin to be driven by external 32.768 kHz source
 0 = Disable external 32.768 kHz input
- bit 2 **CRSTRIM:** Coarse Trim Mode Enable bit
 Coarse Trim mode results in the MCP7940N applying digital trimming every 64 Hz clock cycle.
 1 = Enable Coarse Trim mode. If SQWEN = 1, MFP will output trimmed 64 Hz⁽¹⁾ nominal clock signal.
 0 = Disable Coarse Trim mode
 See [Section 5.6 “Digital Trimming”](#) for details
- bit 1-0 **SQWFS<1:0>:** Square Wave Clock Output Frequency Select bits
If SQWEN = 1 and CRSTRIM = 0:
 Selects frequency of clock output on MFP
 00 = 1 Hz⁽¹⁾
 01 = 4.096 kHz⁽¹⁾
 10 = 8.192 kHz⁽¹⁾
 11 = 32.768 kHz
If SQWEN = 0 or CRSTRIM = 1:
 Unused.

Note 1: The 8.192 kHz, 4.096 kHz, 64 Hz, and 1 Hz square wave clock output frequencies are affected by digital trimming.

5.5.1 SQUARE WAVE OUTPUT MODE

The MCP7940N can be configured to generate a square wave clock signal on MFP. The input clock frequency, FOSC, is divided according to the SQWFS<1:0> bits as shown in [Table 5-8](#).

The square wave output is not available when operating from the backup power supply.

Note: All of the clock output rates are affected by digital trimming except for the 1:1 postscaler value (SQWFS<1:0> = 11).

TABLE 5-8: CLOCK OUTPUT RATES

SQWFS<1:0>	Postscaler	Nominal Frequency
00	1:32,768	1 Hz
01	1:8	4.096 kHz
10	1:4	8.192 kHz
11	1:1	32.768 kHz

Note 1: Nominal frequency assumes Fosc is 32.768 kHz.

5.5.2 ALARM INTERRUPT OUTPUT MODE

The MFP will provide an interrupt output when enabled alarms match and the square wave clock output is disabled. This prevents the user from having to poll the alarm interrupt flag to check for a match.

The alarm interrupt output is available when operating from the backup power supply.

The ALMxIF flags control when the MFP is asserted, as described in the following sections.

5.5.2.1 Single Alarm Operation

When only one alarm module is enabled, the MFP output is based on the corresponding ALMxIF flag and the ALMPOL flag. If ALMPOL = 1, the MFP output reflects the value of the ALMxIF flag. If ALMPOL = 0, the MFP output reflects the inverse of the ALMxIF flag ([Table 5-9](#)).

TABLE 5-9: SINGLE ALARM OUTPUT TRUTH TABLE

ALMPOL	ALMxIF ⁽¹⁾	MFP
0	0	1
0	1	0
1	0	0
1	1	1

Note 1: ALMxIF refers to the interrupt flag corresponding to the alarm module that is enabled.

5.5.2.2 Dual Alarm Operation

When both alarm modules are enabled, the MFP output is determined by a combination of the ALM0IF, ALM1IF, and ALMPOL flags.

If ALMPOL = 1, the ALM0IF and ALM1IF flags are OR'd together and the result is output on MFP. If ALMPOL = 0, the ALM0IF and ALM1IF flags are AND'd together, and the result is inverted and output on MFP ([Table 5-10](#)). This provides the user with flexible options for combining alarms.

Note: If ALMPOL = 0 and both alarms are enabled, the MFP will only assert when both ALM0IF and ALM1IF are set.

TABLE 5-10: DUAL ALARM OUTPUT TRUTH TABLE

ALMPOL	ALM0IF	ALM1IF	MFP
0	0	0	1
0	0	1	1
0	1	0	1
0	1	1	0
1	0	0	0
1	0	1	1
1	1	0	1
1	1	1	1

5.5.3 GENERAL PURPOSE OUTPUT MODE

If the square wave clock output and both alarm modules are disabled, the MFP acts as a general purpose output. The output logic level is controlled by the OUT bit.

The general purpose output is not available when operating from the backup power supply.

MCP7940N

Legend: — = unimplemented location, read as '0'. Shaded cells are not used in output configuration.

5.6 Digital Trimming

The MCP7940N features digital trimming to correct for inaccuracies of the external crystal or clock source, up to roughly ± 129 PPM when CRSTRIM = 0. In addition to compensating for intrinsic inaccuracies in the clock, this feature can also be used to correct for error due to temperature variation. This can enable the user to achieve high levels of accuracy across a wide temperature operating range.

Digital trimming consists of the MCP7940N periodically adding or subtracting clock cycles, resulting in small adjustments in the internal timing. The adjustment

occurs once per minute when CRSTRIM = 0. The SIGN bit specifies whether to add cycles or to subtract them. The TRIMVAL<6:0> bits are used to specify by how many clock cycles to adjust. Each step in the TRIMVAL<6:0> value equates to adding or subtracting two clock pulses to or from the 32.768 kHz clock signal. This results in a correction of roughly 1.017 PPM per step when CRSTRIM = 0. Setting TRIMVAL<6:0> to 0x00 disables digital trimming.

Digital trimming also occurs while operating off the backup supply.

0000010 = Add or subtract 4 clock cycles every minute
0000001 = Add or subtract 2 clock cycles every minute
0000000 = Disable digital trimming

When CRSTRIM = 1:

11111111 = Add or subtract 254 clock cycles 128 times per second
11111110 = Add or subtract 252 clock cycles 128 times per second
.
.
.
0000010 = Add or subtract 4 clock cycles 128 times per second
0000001 = Add or subtract 2 clock cycles 128 times per second
0000000 = Disable digital trimming

MCP7940N

5.6.1 CALIBRATION

In order to perform calibration, the number of error clock pulses per minute must be found and the corresponding trim value must be loaded into TRIMVAL<6:0>.

There are two methods for determining the trim value. The first method involves measuring an output frequency directly and calculating the deviation from ideal. The second method involves observing the number of seconds gained or lost over a period of time.

Once the OSCTRIM register has been loaded, digital trimming will automatically occur every minute.

5.6.1.1 Calibration by Measuring Frequency

To calibrate the MCP7940N by measuring the output frequency, perform the following steps:

1. Enable the crystal oscillator or external clock input by setting the ST bit or EXTOSC bit, respectively.
2. Ensure TRIMVAL<6:0> is reset to 0x00.
3. Select an output frequency by setting SQWFS<1:0>.
4. Set SQWEN to enable the square wave output.
5. Measure the resulting output frequency using a calibrated measurement tool, such as a frequency counter.
6. Calculate the number of error clocks per minute (see Equation 5-2).

EQUATION 5-2: CALCULATING TRIM VALUE FROM MEASURED FREQUENCY

$$\text{TRIMVAL}<6:0> = \frac{(F_{IDEAL} - F_{MEAS}) \cdot \frac{32768}{F_{IDEAL}} \cdot 60}{2}$$

Where:

F_{IDEAL} = Ideal frequency based on SQWFS<1:0>

F_{MEAS} = Measured frequency

- If the number of error clocks per minute is negative, then the oscillator is *faster* than ideal and the SIGN bit must be cleared.
 - If the number of error clocks per minute is positive, then the oscillator is *slower* than ideal and the SIGN bit must be set.
7. Load the correct value into TRIMVAL<6:0>.

Note: Using a lower output frequency and/or averaging the measured frequency over a number of clock pulses will reduce the effects of jitter and improve accuracy.

5.6.1.2 Calibration by Observing Time Deviation

To calibrate the MCP7940N by observing the deviation over time, perform the following steps:

1. Ensure TRIMVAL<6:0> is reset to 0x00.
2. Load the timekeeping registers to synchronize the MCP7940N with a known-accurate reference time.
3. Enable the crystal oscillator or external clock input by setting the ST bit or EXTOSC bit, respectively.
4. Observe how many seconds are gained or lost over a period of time (larger time periods offer more accuracy).
5. Calculate the PPM deviation (see Equation 5-3).

EQUATION 5-3: CALCULATING ERROR PPM

$$PPM = \frac{SecDeviation}{ExpectedSec} \cdot 1000000$$

Where:

$ExpectedSec$ = Number of seconds in chosen period

$SecDeviation$ = Number of seconds gained or lost

- If the MCP7940N has gained time relative to the reference clock, then the oscillator is *faster* than ideal and the SIGN bit must be cleared.
 - If the MCP7940N has lost time relative to the reference clock, then the oscillator is *slower* than ideal and the SIGN bit must be set.
6. Calculate the trim value (see Equation 5-4).

EQUATION 5-4: CALCULATING TRIM VALUE FROM ERROR PPM

$$\text{TRIMVAL}<6:0> = \frac{PPM \cdot 32768 \cdot 60}{1000000 \cdot 2}$$

7. Load the correct value into TRIMVAL<6:0>.

Note 1: Choosing a longer time period for observing deviation will improve accuracy.

2: Large temperature variations during the observation period can skew results.

5.6.2 COARSE TRIM MODE

When CRSTRIM = 1, Coarse Trim mode is enabled. While in this mode, the MCP7940N will apply trimming at a rate of 128 Hz. If SQWEN is set, the MFP will output a trimmed 64 Hz nominal clock signal.

Because trimming is applied at a rate of 128 Hz rather than once every minute, each step of the TRIMVAL<6:0> value has a significantly larger effect on the resulting time deviation and output clock frequency.

By monitoring the MFP output frequency while in this mode, the user can easily observe the TRIMVAL<6:0> value affecting the clock timing.

- Note 1:** The 64 Hz Coarse Trim mode square wave output is not available while operating from the backup power supply.
- 2:** With Coarse Trim mode enabled, the TRIMVAL<6:0> value has a drastic effect on timing. Leaving the mode enabled during normal operation will likely result in inaccurate time.

TABLE 5-12: SUMMARY OF REGISTERS ASSOCIATED WITH DIGITAL TRIMMING

Legend: — = unimplemented location, read as '0'. Shaded cells are not used by digital trimming.

MCP7940N

5.7 Battery Backup

The MCP7940N features a backup power supply input (VBAT) that can be used to provide power to the time-keeping circuitry, RTCC registers, and SRAM while primary power is unavailable. The MCP7940N will automatically switch to backup power when V_{CC} falls below V_{TRIP} , and back to V_{CC} when it is above V_{TRIP} .

The VBATEN bit must be set to enable the VBAT input.

The following functionality is maintained while operating on backup power:

- Timekeeping
- Alarms
- Alarm Output
- Digital Trimming
- RTCC Register and SRAM Contents

The following features are not available while operating on backup power:

- I²C Communication
- Square Wave Clock Output
- General Purpose Output

5.7.1 POWER-FAIL TIME-STAMP

The MCP7940N includes a power-fail time-stamp module that stores the minutes, hours, date, and month when primary power is lost and when it is restored (Figure 5-8). The PWRFAIL bit is also set to indicate that a power failure occurred.

Note: Throughout this section, references to the register and bit names for the Power-Fail Time-Stamp module are referred to generically by the use of 'x' in place of the specific module name. Thus, "PWRxxMIN" might refer to the minutes register for Power-Down or Power-Up.

To utilize the power-fail time-stamp feature, a backup power supply must be available with the VBAT input enabled, and the oscillator should also be running to ensure accurate functionality.

- Note 1:** The PWRFAIL bit must be cleared to log new time-stamp data. This is to ensure previous time-stamp data is not lost.
- 2:** Clearing the PWRFAIL bit will clear all time-stamp registers.

6.0 ON-BOARD MEMORY

The MCP7940N has 64 bytes of SRAM for general purpose usage. It is retained when the primary power supply is removed if a backup supply is present and enabled.

Although the SRAM is a separate block from the RTCC registers, they are accessed using the same control byte, '1101111X'.

6.1 SRAM/RTCC Registers

The RTCC registers are located at addresses 0x00 to 0x1F, and the SRAM is located at addresses 0x20 to 0x5F. The SRAM can be accessed while the RTCC registers are being internally updated. The SRAM is not initialized by a Power-On Reset (POR).

Neither the RTCC registers nor the SRAM can be accessed when the device is operating off the backup power supply.

6.1.1 SRAM/RTCC REGISTER BYTE WRITE

Following the Start condition from the host, the control code and the R/W bit (which is a logic low) are clocked onto the bus by the host transmitter. This indicates to the addressed client receiver that the address byte will follow after it has generated an Acknowledge bit during the ninth clock cycle. Therefore, the next byte transmitted by the host is the address and will be written into the Address Pointer of the MCP7940N. After receiving another Acknowledge bit from the MCP7940N, the host

device transmits the data byte to be written into the addressed memory location. The MCP7940N stores the data byte into memory and acknowledges again, and the host generates a Stop condition (Figure 6-1).

If an attempt is made to write to an address past 0x5F, the MCP7940N will not acknowledge the address or data bytes, and no data will be written. After a byte Write command, the internal Address Pointer will point to the address location following the one that was just written.

6.1.2 SRAM/RTCC REGISTER SEQUENTIAL WRITE

The write control byte, address, and the first data byte are transmitted to the MCP7940N in the same way as in a byte write. But instead of generating a Stop condition, the host transmits additional data bytes. Upon receipt of each byte, the MCP7940N responds with an Acknowledge, during which the data is latched into memory and the Address Pointer is internally incremented by one. As with the byte write operation, the host ends the command by generating a Stop condition (Figure 6-2).

There is no limit to the number of bytes that can be written in a single command. However, because the RTCC registers and SRAM are separate blocks, writing past the end of each block will cause the Address Pointer to roll over to the beginning of the same block. Specifically, the Address Pointer will roll over from 0x1F to 0x00, and from 0x5F to 0x20.

FIGURE 6-1: SRAM/RTCC BYTE WRITE

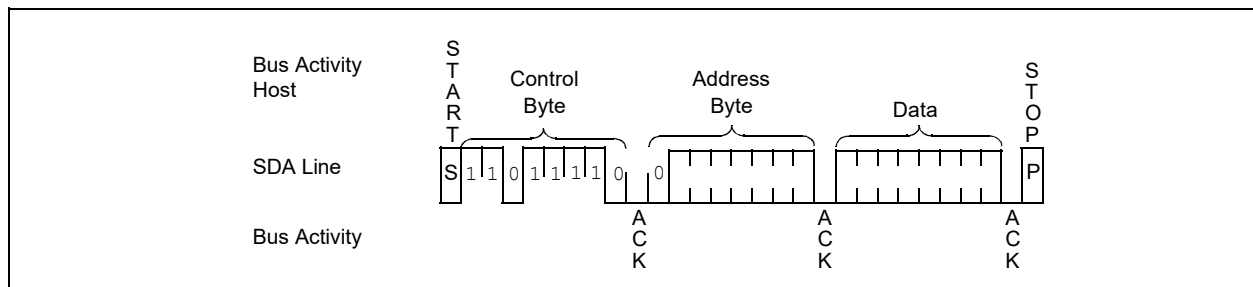

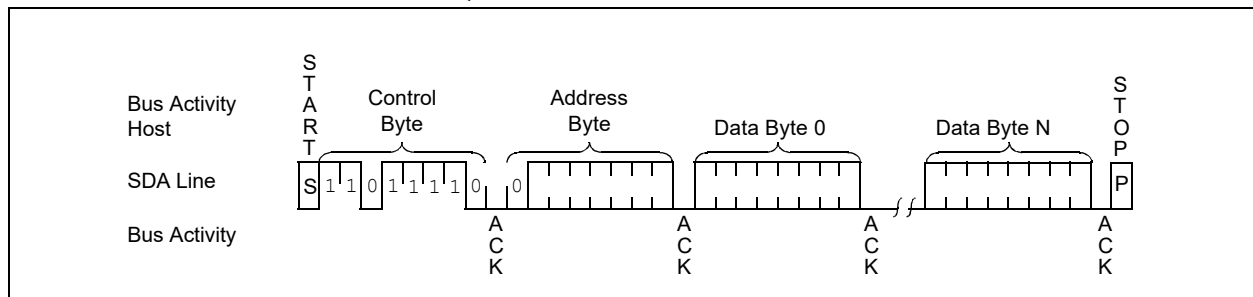

FIGURE 6-2: SRAM/RTCC SEQUENTIAL WRITE

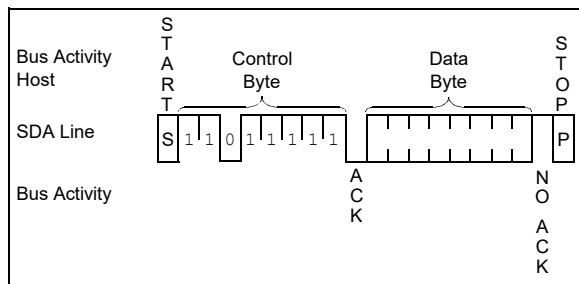

MCP7940N

6.1.3 SRAM/RTCC REGISTER CURRENT ADDRESS READ

The MCP7940N contains an address counter that maintains the address of the last byte accessed, internally incremented by one. Therefore, if the previous read access was to address n (n is any legal address), the next current address read operation would access data from address $n + 1$.

Upon receipt of the control byte with R/\bar{W} bit set to '1', the MCP7940N issues an Acknowledge and transmits the 8-bit data word. The host will not acknowledge the transfer but does generate a Stop condition and the MCP7940N discontinues transmission (Figure 6-3).

FIGURE 6-3: SRAM/RTCC CURRENT ADDRESS READ

6.1.4 SRAM/RTCC REGISTER RANDOM READ

Random read operations allow the host to access any memory location in a random manner. To perform this type of read operation, first the address must be set. This is done by sending the address to the MCP7940N as part of a write operation (R/\bar{W} bit set to '0'). After the

address is sent, the host generates a Start condition following the Acknowledge. This terminates the write operation, but not before the internal Address Pointer is set. Then, the host issues the control byte again but with the R/\bar{W} bit set to a '1'. The MCP7940N will then issue an Acknowledge and transmit the 8-bit data word. The host will not acknowledge the transfer but it does generate a Stop condition which causes the MCP7940N to discontinue transmission (Figure 6-4). After a random Read command, the internal address counter will point to the address location following the one that was just read.

6.1.5 SRAM/RTCC REGISTER SEQUENTIAL READ

Sequential reads are initiated in the same way as a random read except that after the MCP7940N transmits the first data byte, the host issues an Acknowledge as opposed to the Stop condition used in a random read. This Acknowledge directs the MCP7940N to transmit the next sequentially addressed 8-bit word (Figure 6-5). Following the final byte transmitted to the host, the host will NOT generate an Acknowledge but will generate a Stop condition. To provide sequential reads, the MCP7940N contains an internal Address Pointer which is incremented by one at the completion of each operation. This Address Pointer allows the entire memory block to be serially read during one operation.

Because the RTCC registers and SRAM are separate blocks, reading past the end of each block will cause the Address Pointer to roll over to the beginning of the same block. Specifically, the Address Pointer will roll over from 0x1F to 0x00, and from 0x5F to 0x20.

ALTERNATE LEAD DESIGN (NOTE 5)

Dimension Limits	Units	INCHES		
		MIN	NOM	MAX
Number of Pins	N	8		
Pitch	e	.100 BSC		
Top to Seating Plane	A	-	-	.210
Molded Package Thickness	A2	.115	.130	.195
Base to Seating Plane	A1	.015	-	-
Shoulder to Shoulder Width	E	.290	.310	.325
Molded Package Width	E1	.240	.250	.280
Overall Length	D	.348	.365	.400
Tip to Seating Plane	L	.115	.130	.150
Lead Thickness	c	.008	.010	.015
Upper Lead Width	b1	.040	.060	.070
Lower Lead Width	b	.014	.018	.022
Overall Row Spacing	§ eB	-	-	.430

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. § Significant Characteristic
3. Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" per side.
4. Dimensioning and tolerancing per ASME Y14.5M
BSC: Basic Dimension. Theoretically exact value shown without tolerances.
5. Lead design above seating plane may vary, based on assembly vendor.

APPENDIX A: REVISION HISTORY

Revision J (04/2022)

Updated Data Sheet for MCP7940N I2C RTCC to include Automotive part numbers and other fixes; Updated SOIC, TDFN and TSSOP package drawings; Replaced terminology “Master” and “Slave” with “Host” and “Client” respectively.

Revision H (10/2019)

Added notes regarding automotive grade availability; Corrected MSOP marking rotation; Updated package drawings SOIC and PDIP.

Revision G (07/2018)

Updated Section 5.5.1 “Square Wave Output Mode”.

Revision F (03/2014)

Updated overall content for improved clarity. Added detailed descriptions of registers. Updated block diagram and application schematic.

Defined names for all bits and registers, and renamed the bits shown in Table 7-1 for clarification.

Renamed the DC characteristics shown in Table 7-2 for clarification.

TABLE 7-1: BIT NAME CHANGES

Old Bit Name	New Bit Name
OSCON	OSCRUN
VBAT	PWRFAIL
LP	LPYR
SQWE	SQWEN
ALM0	ALM0EN
ALM1	ALM1EN
RS0	SQWFS0
RS1	SQWFS1
RS2	CRSTRIM
CALIBRATION	TRIMVAL<6:0>
ALM0POL	ALMPOL

TABLE 7-2: DC CHARACTERISTIC NAME CHANGES

Old Name	Old Symbol	New Name	New Symbol
Operating current SRAM	Icc Read	SRAM/RTCC register operating current	ICCREAD
	Icc Write		ICCWWRITE
Operating current	Ivcc	Timekeeping current	ICCT
	IBAT	Timekeeping backup current	IBATT
Standby current	Iccs	Vcc data retention current (oscillator off)	ICCDAT

Old Bit Name	New Bit Name
ALM1POL	ALMPOL
ALM0C<2:0>	ALM0MSK<2:0>
ALM1C<2:0>	ALM1MSK<2:0>

Revision E (01/2013)

Revised Table 1-2: AC Characteristics; temperature range

Revision D (11/2012)

Added Extended Temp.

Revision C (12/2011)

Added DC/AC Char. Charts.

Revision B (09/2011)

- Added Figure 1-2
- Added Parameter D15 to Table 1-1
- Added Section 3.3 “Oscillator Input/Output (X1, X2)”, Section 3.4 “Multifunction Pin (MFP)”, Section 3.5 “Backup Supply (VBAT)”
- Added Figure 5-1
- Updated Section 5.2.3 “Oscillator Failure Status”, Section 5.2.4 “Crystal Specs”, Section 5.2.5 “Power-fail Time-stamp”.

Revision A (04/2011)

Original release of this document.

MCP7940N

THE MICROCHIP WEBSITE

Microchip provides online support via our website at www.microchip.com. This website is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the website contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip website at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the website at: <http://microchip.com/support>

PRODUCT IDENTIFICATION SYSTEM (NON-AUTOMOTIVE)

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office. Not every possible ordering combination is listed below.

<u>PART NO.</u>	<u>X</u> ⁽¹⁾	<u>X</u>	<u>XX</u>	
Device	Tape and Reel Option	Temperature Range	Package	
Device:	MCP7940N =	1.8V - 5.5V I ² C Serial RTCC		
	MCP7940NT=	1.8V - 5.5V I ² C Serial RTCC (Tape and Reel)		
Tape and Reel Option⁽¹⁾:	Blank =	Tube		
	T =	Tape and Reel		
Temperature Range:	I =	-40°C to +85°C (Industrial)		
	E =	-40°C to +125°C (Extended)		
Package:	MS =	8-Lead Plastic Micro Small Outline		
	P =	8-Lead Plastic PDIP (300 mil body, I-temp only)		
	SN =	8-Lead Plastic Small Outline (3.90 mm body)		
	MNY ⁽¹⁾ =	8-Lead Plastic Dual Flat, No Lead (I-temp only)		
	ST =	8-Lead Plastic Thin Shrink Small Outline (4.4 mm body, I-temp only)		

Examples:

- a) MCP7940N-E/MS: Extended Temperature, MSOP package.
- a) MCP7940NT-E/MS: Extended Temperature, MSOP package, Tape and Reel.
- b) MCP7940N-I/P: Industrial Temperature, PDIP package.
- c) MCP7940N-I/SN: Industrial Temperature, SOIC package.
- d) MCP7940NT-I/SN: Industrial Temperature, SOIC package, Tape and Reel.
- e) MCP7940NT-E/SN: Extended Temperature, SOIC package, Tape and Reel.
- f) MCP7940NT-E/SN: Extended Temperature, SOIC package, Tape and Reel.
- g) MCP7940NT-I/MNY: Industrial Temperature, TDFN package, Tape and Reel.
- h) MCP7940NT-I/ST: Industrial Temperature, TSSOP package, Tape and Reel.

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with our Microchip Sales Office for package availability with the Tape and Reel option.

2: "Y" indicates a Nickel Palladium Gold (NiPdAu) finish.

MCP7940N

PRODUCT IDENTIFICATION SYSTEM (AUTOMOTIVE)

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office. Not every possible ordering combination is listed below.

<u>PART NO.</u>	<u>X</u> ⁽¹⁾	<u>-X</u>	<u>/XX</u>	<u>XXX</u> ^(2, 3)	Examples:
Device	Tape and Reel Option	Temperature Range	Package	Variant	
Device:	MCP7940N	= 1.8V - 5.5V I ² C	Serial	RTCC	a) MCP7940N-E/MSVAO: Automotive Grade, MSOP Package
Tape and Reel Option⁽¹⁾:	Blank	= Tube			b) MCP7940N-E/SNVAO: Automotive Grade, SOIC package
	T	= Tape and Reel			c) MCP7940NT-E/MSVAO: Automotive Grade, MSOP Package, Tape and Reel
Temperature Range:	I	= -40°C to +85°C (AEC-Q100 Grade 3)			d) MCP7940NT-E/SNVAO: Automotive Grade, SOIC package, Tape and Reel
	E	= -40°C to +125°C (AEC-Q100 Grade 1)			
Package:	MNY	= 8-Lead Plastic Dual Flat, No Lead (I-temp only)			Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with our Microchip Sales Office for package availability with the Tape and Reel option.
	MS	= 8-Lead Plastic Micro Small Outline			2: The VAO/VXX automotive variants have been designed, manufactured, tested and qualified in accordance with AEC-Q100 requirements for automotive applications.
	SN	= 8-Lead Plastic Small Outline (3.90 mm body)			3: For customers requesting a PPAP, a customer-specific part will be generated and provided. A PPAP is not provided for VAO part numbers.
	ST	= 8-Lead Plastic Thin Shrink Small Outline (4.4 mm body, I-temp only)			
Variant^(2, 3):	VAO	= Standard Automotive			

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.
