Notification Text:

SYST-13LJNZ564

Microchip has released a new Datasheet for the dsPIC33CK1024MP710 Family Data Sheet of devices. If you are using one of these devices please read the document located at dsPIC33CK1024MP710 Family Data Sheet.

Notification Status: Final

Description of Change:
This revision incorporates the following updates:

• Sections:
– Changed Functional Safety Support – ISO 26262/IEC 61508/IEC 60730 title and content.
– Added new content to the first paragraph in 5.6.1 Flash Partition Swapping.
– Added new paragraph to 12.2 Architecture Overview.
– Added new paragraph to 30.6 Brown-out Reset (BOR). – Added note to 30.7 Dual Watchdog Timer (WDT).

• Tables:
– Updated Table 1. dsPIC33CK1024MP710 Motor Control/Power Supply Families with CAN FD, Table 2. dsPIC33CK1024MP710 Motor Control/Power Supply Families with No CAN FD, Table 5. 80-Pin TQFP, Table 8-3. Remappable Pin Inputs, Table 8-5. Remappable Output Pin Registers, Table 8-6. Output Selection for Remappable Pins (RPn), Table 33-3. Thermal Operating Conditions, Table 33-36. UARTx Module I/O Timing Requirements, Table 33-39. DACx Module Specifications and Table 34-19. DACx Module Specifications.

• Registers:
– Updated 3.5.29 Y Page Register, 7.7.1 Interrupt Request Flags Register 0, 7.7.14 Interrupt Enable Register 0, 9.11.1 Oscillator Control Register, 11.2.1 CAN Control Register Low, 12.6.8 Auxiliary Combinational Trigger Register Low, 12.6.9 Auxiliary Combinational Trigger Register High, 12.6.10 Auxiliary Combinatorial PWM Logic Control Register y, 12.6.19 Auxiliary PWM Generator xy PCI Register Low, 12.6.20 Auxiliary PWM Generator xy PCI Register High, 12.6.22 Auxiliary PWM Generator x Leading-Edge Blanking Register High, 14.4.4 DACx Control Low Register, 14.4.8 DAC Slope x Control Low Register, 22.6.1 CCPx Control 1 Low Register and 28.1.1 Deadman Timer Control Register.
– Changes all instances of PWM, FSMINPER, PG, MPER, PGxPER, PGxPHASE, PGxCAP, PGxCON, PGxTRIG, PGxSTAT, PGxDCA in the Auxiliary PWM section to APWM, AFSMINPER, APG, AMPER, APGxPER, APGxPHASE, APGxCAP, APGxCON, APGxTRIG, APGxSTAT, APGxDCA.

• Figures:
– Updated Figure 11-1. CAN FD Module Block Diagram.

Impacts to Data Sheet: See above details.

Reason for Change: To Improve Productivity.

Change Implementation Status: Complete

Date Document Changes Effective: 25 Apr 2023

NOTE: Please be advised that this is a change to the document only the product has not been changed.

Markings to Distinguish Revised from Unrevised Devices:N/A

High-Performance Digital Signal Controllers with High-Resolution PWM and CAN Flexible Data-Rate (CAN FD)

dsPIC33CK1024MP710 Family

Operating Conditions

- 3V to 3.6V, -40°C to +125°C:
  - DC to 100 MIPS
- 3V to 3.6V, -40°C to +150°C:
  - DC to 70 MIPS

Core: dsPIC33CK CPU

- 256-1024 Kbytes of Program Flash with ECC and 128 Kbytes of Data RAM
- Fast Six-Cycle Divide
- Flash with Dual Partition for LiveUpdate Capabilities
- LiveUpdate
- Code Efficient (C and Assembly) Architecture
- 40-Bit Wide Accumulators
- Single-Cycle (MAC/MPY) with Dual Data Fetch
- Single-Cycle, Mixed-Sign MUL Plus Hardware Divide
- 32-Bit Multiply Support
- Five Sets of Interrupt Context Selected Registers for Fast Interrupt Response
- Zero Overhead Looping
- RAM Memory Built-In Self-Test (MBIST)

Clock Management

- Fast RC (FRC)
- Internal Oscillator
- Programmable PLLs and Oscillator Clock Sources
- Reference Clock Output
- Fail-Safe Clock Monitor (FSCM)
- Fast Wake-up and Start-up
- 8 MHz Backup FRC (BFRC) with a Divider (244 decimal) to provide a Nominal 32.768 kHz Output with a 50% Duty Cycle

Power Management

- Low-Power Management Modes (Sleep, Idle, Doze)
- Integrated Power-on Reset and Brown-out Reset

High-Resolution PWM with Fine Edge Placement

- Up to Twelve PWM Channels
- 250 ps PWM Resolution
- Applications include:
  - DC/DC converters
  - AC/DC power supplies
  - Uninterruptable Power Supply (UPS)
  - Motor Control: BLDC, PMSM, SR, ACIM

Timers/Output Compare/Input Capture

- One General Purpose 16-Bit Timer
- Peripheral Trigger Generator (PTG) Module
- Eight SCCP Modules:
  - Timer, Capture/Compare and PWM modes
  - 16 or 32-bit time base
  - 16 or 32-bit capture
  - Four-deep capture buffer
  - Fully asynchronous operation, available in Sleep modes
- Nine MCCP/SCCP modules which include Timer, Capture/Compare and PWM:
  - One MCCP
  - Eight SCCPs
  - 16 or 32-bit time base
  - 16 or 32-bit capture
  - Four-deep capture buffer

Advanced Analog Features

- Five ADC Modules:
  - 12-bit, 3.5 Msps ADC
  - Up to 27 conversion channels
  - 250 ns conversion latency
- Six DAC/Analog Comparator Modules:
  - 12-bit DACs with hardware slope compensation
  - 15 ns analog comparators
- Shared DAC/Analog Output:
  - DAC/analog comparator outputs
- Three Op Amp Modules – 20 MHz GBW:
  - 40 V/s Slew Rate
  - ±1 mV offset

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Communication Interfaces

- Three UART Modules:
  - Support for DMX, LIN/J2602 protocols
- Three 4-Wire SPI/I^2S Modules
- Two CAN Flexible Data-Rate (FD) Modules
- Three I^2C Modules:
  - Support for SMBus
- PPS to Allow Function Remap
- Two SENT Modules

Direct Memory Access (DMA)

- Eight DMA Channels

Peripheral Features

- Three Quadrature Encoder Interfaces (QEIs):
  - Four inputs: Phase A, Phase B, Home, Index
- Eight Configurable Logic Cells (CLCs) with Internal Connections to Select Peripherals and PPS
- Two Current Bias Generators (CBGs)

Debugger Development Support

- In-Circuit and In-Application Programming
- Three Complex, Five Simple Breakpoints
- IEEE 1149.2 Compatible (JTAG) Boundary Scan
- Trace Buffer and Run-Time Watch

Safety Features

- DMT (Deadman Timer)
- ECC (Error Correcting Code) for Flash Memory
- WDT (Watchdog Timer)
- CodeGuard™ Security
- CRC (Cyclic Redundancy Check)
- Flash OTP by ICSP™ Write Inhibit
- RAM Memory Built-In Self Test (MBIST)
- Two-Speed Start-up
- Fail-Safe Clock Monitoring (FSCM)
- Backup FRC (BFRC)
- Capless Internal Voltage Regulator
- Virtual Pins for Redundancy and Monitoring

Functional Safety Support – ISO 26262/IEC 61508/IEC 60730

The devices in this family are ISO 26262 compliant and developed following the ISO 26262 process. To learn about various Functional Safety standards and target safety levels that this device family supports, visit www.microchip.com/dsPIC33-Functional-Safety.

Qualification Support

- AEC-Q100 REV-H (Grade 1: -40°C to +125°C) Compliant
- AEC-Q100 REV-H (Grade 0: -40°C to +150°C) Compliant

dsPIC33CK1024MP710 Product Families

The device names, pin counts, memory sizes and peripheral availability of each device are listed in Table 1 and Table 2. The following pages show their pinout diagrams.

Notes:

1. **Shaded** pins are up to 5.5 V_{DC} tolerant.
2. The large center pad on the bottom of the package may be left floating or connected to V_{SS}. The four-corner anchor pads are internally connected to the large bottom pad, and therefore, must be connected to the same net as the large center pad.

To Our Valued Customers

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Website at:

www.microchip.com/

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Website: www.microchip.com/
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our website at www.microchip.com/ to receive the most current information on all of our products.

1. Device Overview

Notes:

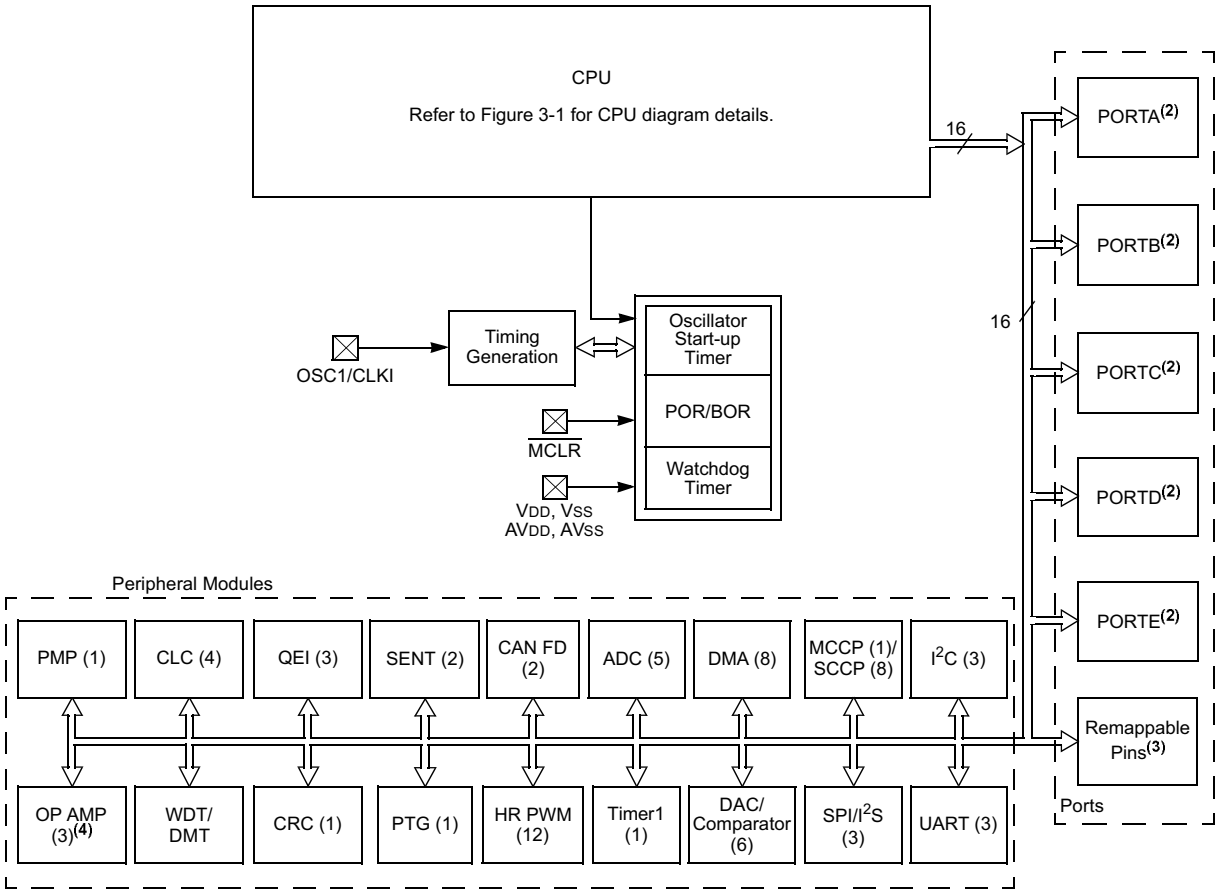

1. This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive resource. To complement the information in this data sheet, refer to the related section of the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip website (www.microchip.com)
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

This document contains device-specific information for the dsPIC33CK1024MP710 Digital Signal Controller (DSC) devices.

dsPIC33CK1024MP710 devices contain extensive Digital Signal Processor (DSP) functionality with a high-performance, DSC architecture.

Figure 1-1 shows a general block diagram of the core and peripheral modules of the dsPIC33CK1024MP710 family.

Figure 1-1. dsPIC33CK1024MP710 Family Block Diagram(1)

Notes:

1. The numbers in the parentheses are the number of instantiations of the module indicated.
2. Not all I/O pins or features are implemented on all device pinout configurations. See Table 1-1 for specific implementations by pin count.
3. Some peripheral I/Os are only accessible through Peripheral Pin Select (PPS).

2. Guidelines for Getting Started with Digital Signal Controllers

2.1 Basic Connection Requirements

Getting started with the family devices of the dsPIC33CK1024MP710 requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names which must always be connected:

- All V_{DD} and V_{SS} pins
  (see 2.2. Decoupling Capacitors)
- All AV_{DD} and AV_{SS} pins
  regardless if ADC module is not used (see 2.2. Decoupling Capacitors)
- $\overline{MCLR}$ pin
  (see 2.3. Master Clear (MCLR) Pin)
- PGCx/PGDx pins
  used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see 2.4. ICSP Pins)
- OSCI and OSCO pins
  when an external oscillator source is used (see 2.5. External Oscillator Pins)

2.2 Decoupling Capacitors

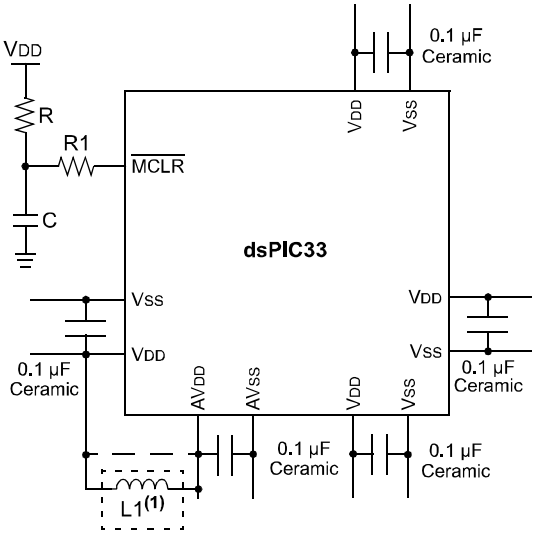

The use of decoupling capacitors on every pair of power supply pins, such as V_{DD}, V_{SS}, AV_{DD} and AV_{SS} is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** Recommendation of 0.1 µF (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended to use ceramic capacitors.
- **Placement on the Printed Circuit Board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high-frequency noise:** If the board is experiencing high-frequency noise above tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 µF to 0.001 µF. Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 µF in parallel with 0.001 µF.
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum, thereby reducing PCB track inductance.

Figure 2-1. Recommended Minimum Connection

Note 1: As an option, instead of a hard-wired connection, an inductor (L1) can be substituted between VDD and AVDD to improve ADC noise rejection. The inductor impedance should be less than 1Ω and the inductor capacity greater than 10 mA.

Where:

$$f = \frac{F_{CNV}}{2}$$ (i.e., ADC Conversion Rate/2)

$$f = \frac{1}{(2\pi\sqrt{LC})}$$

$$L = \left(\frac{1}{(2\pi f\sqrt{C})}\right)^2$$

2.3 Master Clear ($\overline{MCLR}$) Pin

The $\overline{MCLR}$ pin provides two specific device functions:

- Device Reset
- Device Programming and Debugging

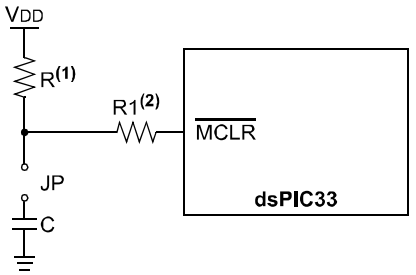

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{MCLR}$ pin. Consequently, specific voltage levels (V_{IH} and V_{IL}) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in Figure 2-2, it is recommended that the capacitor, C, be isolated from the $\overline{MCLR}$ pin during programming and debugging operations.

Place the components, as shown in Figure 2-2, within one-quarter inch (6 mm) from the $\overline{MCLR}$ pin.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Figure 2-2. Example of $\overline{MCLR}$ Pin Connections

Notes:

1. R ≤ 10 kΩ is recommended. A suggested starting value is 10 kΩ. Ensure that the $\overline{MCLR}$ pin V_{IH} and V_{IL} specifications are met.
2. R1 ≤ 470Ω will limit any current flowing into $\overline{MCLR}$ from the external capacitor, C, in the event of $\overline{MCLR}$ pin breakdown due to Electrostatic Discharge (ESD) or Electrical Overstress (EOS). Ensure that the $\overline{MCLR}$ pin V_{IH} and V_{IL} specifications are met.

2.4 ICSP Pins

The PGCx and PGDx pins are used for ICSP and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGCx and PGDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin Voltage Input High (V_{IH}) and Voltage Input Low (V_{IL}) requirements.

Ensure that the "Communication Channel Select" (i.e., PGCx/PGDx pins) programmed into the device matches the physical connections for the ICSP to PICkit™ 3, MPLAB® ICD 3 or MPLAB REAL ICE™ emulator.

For more information on MPLAB ICD 2, MPLAB ICD 3 and REAL ICE emulator connection requirements, refer to the following documents that are available on the Microchip website.

2.5 External Oscillator Pins

When the Primary Oscillator (POSC) circuit is used to connect a crystal oscillator, special care and consideration is needed to ensure proper operation. The POSC circuit should be tested across the environmental conditions that the end product is intended to be used. The load capacitors specified in the crystal oscillator data sheet can be used as a starting point, however, the parasitic capacitance from the PCB traces can affect the circuit, and the values may need to be altered to ensure proper start-up and operation. Excessive trace length and other physical interaction can lead to poor signal quality. Poorly tuned oscillator circuits can have reduced amplitude, incorrect frequency (runt pulses), distorted waveforms and long start-up times that may result in unpredictable application behavior, such as instruction misexecution, illegal opcode fetch, etc. Ensure that the crystal oscillator circuit is at full amplitude and the correct frequency before the system begins to execute code. In planning the application's routing and I/O assignments, ensure that adjacent port pins, and other signals in close proximity to the oscillator,

© 2022-2023 Microchip Technology Inc. and its subsidiaries

do not have high frequencies, short rise and fall times, and other similar noise. For further information on the Primary Oscillator, see 9.4. Primary Oscillator (POSC).

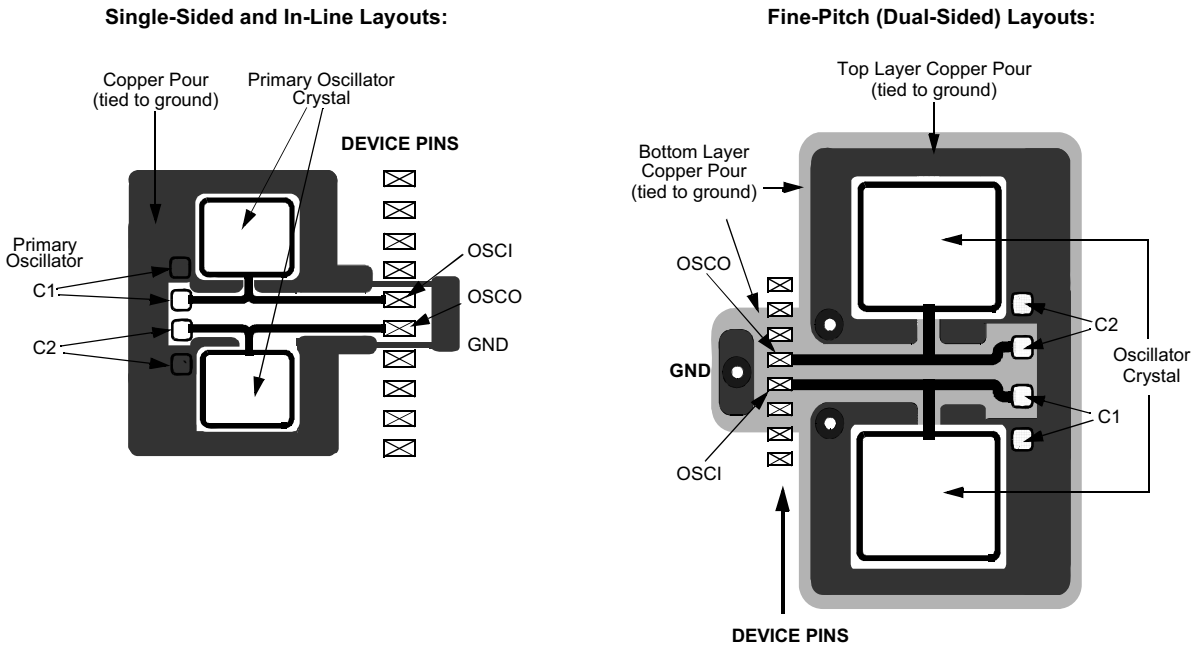

2.6 External Oscillator Layout Guidance

Use best practices during PCB layout to ensure robust start-up and operation. The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. If using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layouts are shown in Figure 2-3. With fine-pitch packages, it is not always possible to completely surround the pins and components. A suitable solution is to tie the broken guard sections to a mirrored ground layer. In all cases, the guard trace(s) must be returned to ground.

2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to a certain frequency (see 9. Oscillator with High-Frequency PLL) to comply with device PLL Start-up conditions. This means that if the external oscillator frequency is outside this range, the application must start up in the FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLFBD, to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration Word.

2.8 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a Logic Low state.

Alternatively, connect a 1k to 10k resistor between V_{SS} and unused pins, and drive the output to logic low.

2.9 Bulk Capacitors

On boards with power traces running longer than six inches in length, it is suggested to use a bulk capacitor for integrated circuits, including DSCs, to supply a local power source. The value of the bulk capacitor should be determined based on the trace resistance that connects the power supply source to the device and the maximum current drawn by the device in the application. In other words, select the bulk capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 µF to 47 µF.

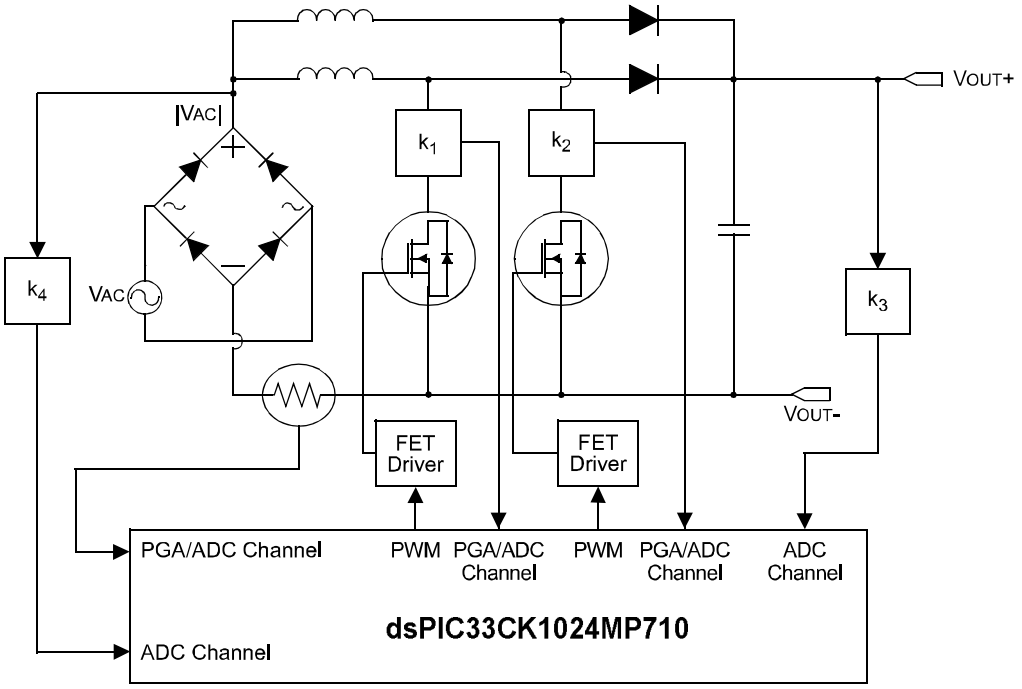

2.10 Targeted Applications

- Power Factor Correction (PFC):
  - Interleaved PFC
  - Critical Conduction PFC
  - Bridgeless PFC
- DC/DC Converters:
  - Buck, Boost, Forward, Flyback, Push-Pull
  - Half/Full-Bridge
  - Phase-Shift Full-Bridge
  - Resonant Converters
- DC/AC:
  - Half/Full-Bridge Inverter
  - Resonant Inverter
- Motor Control:
  - BLDC
  - PMSM
  - SR
  - ACIM

Examples of typical application connections are shown in Figure 2-4 through Figure 2-6.

3. CPU

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Enhanced CPU"** (www.microchip.com/DS70005158).

The dsPIC33CK1024MP710 family CPU has a (data) modified Harvard architecture with an enhanced instruction set, including significant support for Digital Signal Processing (DSP). The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space.

An instruction prefetch mechanism helps maintain throughput and provides predictable execution. Most instructions execute in a single-cycle effective execution rate, with the exception of instructions that change the program flow, the double-word move (`MOV.D`) instruction, PSV accesses and the table instructions. Overhead-free program loop constructs are supported using the `DO` and `REPEAT` instructions, both of which are interruptible at any point.

3.1 Registers

The dsPIC33CK1024MP710 devices have sixteen, 16-bit Working registers in the programmer's model. Each of the Working registers can act as a Data, Address or Address Offset register. The 16th Working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

In addition, the dsPIC33CK1024MP710 devices include four Alternate Working register sets, which consist of W0 through W14. The Alternate Working registers can be made persistent to help reduce the saving and restoring of register content during Interrupt Service Routines (ISRs). The Alternate Working registers can be assigned to a specific Interrupt Priority Level (IPL1 through IPL6) by configuring the CTXTx[2:0] bits in the FALTREG Configuration register. The Alternate Working registers can also be accessed manually by using the `CTXTSWP` instruction. The CCTXI[2:0] and MCTXI[2:0] bits in the CTXTSTAT register can be used to identify the current, and most recent, manually selected Working register sets.

3.2 Instruction Set

The instruction set for dsPIC33CK1024MP710 devices has two classes of instructions: the MCU class of instructions and the DSP class of instructions. These two instruction classes are seamlessly integrated into the architecture and execute from a single execution unit. The instruction set includes many addressing modes and was designed for optimum C compiler efficiency.

Refer to the 31. Instruction Set Summary for more information.

3.3 Data Space Addressing

The base Data Space can be addressed up to 4K words or 8 Kbytes, and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear Data Space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y Data Space boundary is device-specific.

The upper 32 Kbytes of the Data Space memory map can optionally be mapped into Program Space (PS) at any 16K program word boundary. The program-to-Data Space mapping feature, known as Program Space Visibility (PSV), lets any instruction access Program Space as if it were Data Space. Refer to **"Data Memory"** (www.microchip.com/DS70595) for more details on PSV and table accesses.

On dsPIC33CK1024MP710 family devices, overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. The X AGU Circular Addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data re-ordering for radix-2 FFT algorithms.

3.4 Addressing Modes

The CPU supports these addressing modes:

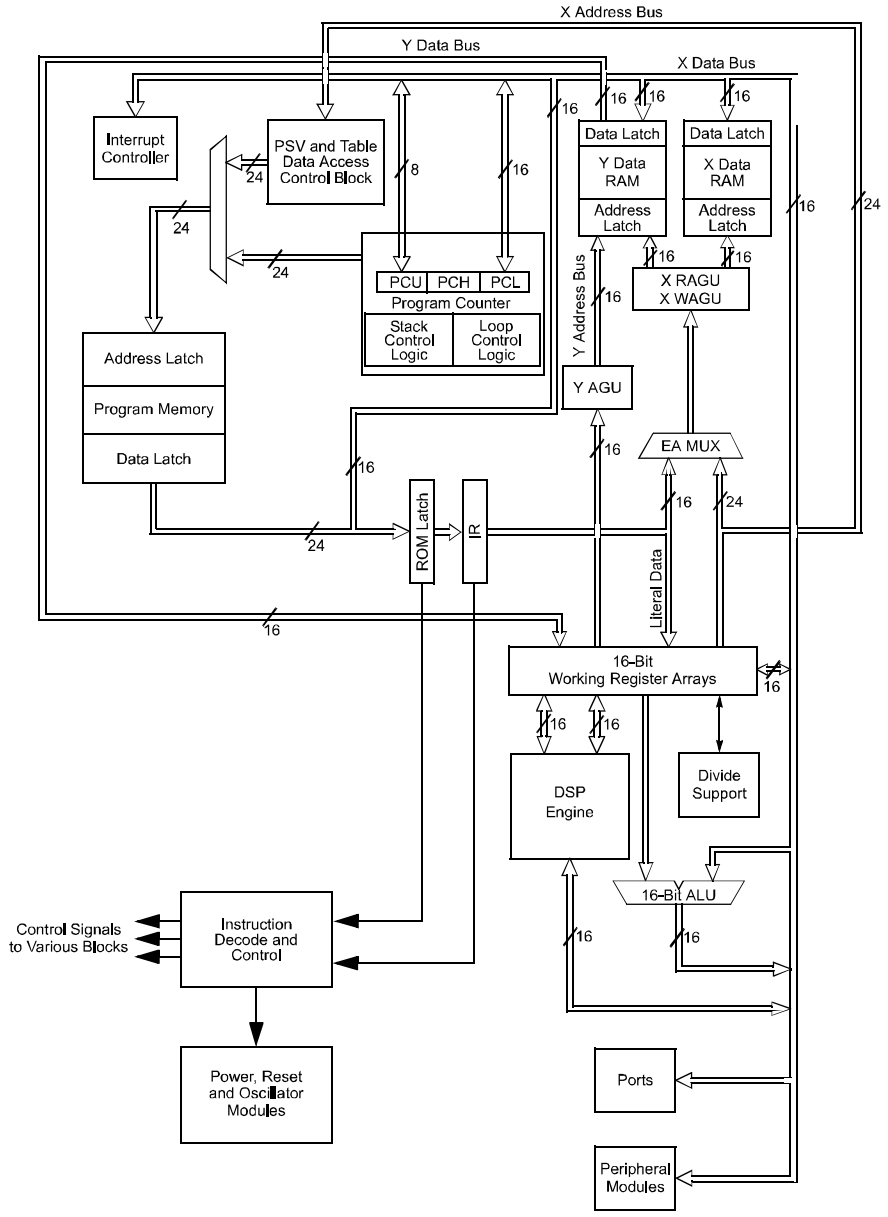

© 2022-2023 Microchip Technology Inc. and its subsidiaries

- Inherent (no operand)
- Relative
- Literal
- Memory Direct
- Register Direct
- Register Indirect

Each instruction is associated with a predefined addressing mode group, depending upon its functional requirements. As many as six addressing modes are supported for each instruction.

3.4.1 Programmer's Model

The programmer's model for the dsPIC33CK1024MP710 family is shown in Figure 3-2. All registers in the programmer's model are memory-mapped and can be manipulated directly by instructions. Table 3-1 lists a description of each register.

In addition to the registers contained in the programmer's model, the dsPIC33CK1024MP710 devices contain control registers for Modulo Addressing, Bit-Reversed Addressing and interrupts. These registers are described in subsequent sections of this document.

All registers associated with the programmer's model are memory-mapped, as shown in Figure 3-2 .

RCOUNT	REPEAT Loop Counter Register
DCOUNT	DO Loop Counter Register
DOSTARTH, DOSTARTL(2)	DO Loop Start Address Register (High and Low)
DOENDH, DOENDL	DO Loop End Address Register (High and Low)
CORCON	Contains DSP Engine, DO Loop Control and Trap Status bits

Notes:

1. Memory-mapped W0 through W14 represent the value of the register in the currently active CPU context.
2. The DOSTARTH and DOSTARTL registers are read-only.

3.5.19 CPU STATUS Register

Name: SR
Offset: 0x42

Notes:

1. The IPL[2:0] bits are concatenated with the IPL[3] bit (CORCON[3]) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL[3] = 1. User interrupts are disabled when IPL[3] = 1.
2. The IPL[2:0] Status bits are read-only when the NSTDIS bit (INTCON1[15]) = 1.
3. A data write to the SR register can modify the SA and SB bits by either a data write to SA and SB or by clearing the SAB bit. To avoid a possible SA or SB Bit Write Race condition, the SA and SB bits should not be modified using bit operations.

Legend: C = Clearable bit

Bit 15 – OA Accumulator A Overflow Status bit

Value	Description
1	Accumulator A has overflowed
0	Accumulator A has not overflowed

Bit 14 – OB Accumulator B Overflow Status bit

Value	Description
1	Accumulator B has overflowed
0	Accumulator B has not overflowed

Bit 13 – SA Accumulator A Saturation 'Sticky' Status bit(3)

Value	Description
1	Accumulator A is saturated or has been saturated at some time
0	Accumulator A is not saturated

Bit 12 – SB Accumulator B Saturation 'Sticky' Status bit(3)

Value	Description
1	Accumulator B is saturated or has been saturated at some time
0	Accumulator B is not saturated

Bit 11 – OAB OA || OB Combined Accumulator Overflow Status bit

Value	Description
1	Accumulator A or B has overflowed
0	Neither Accumulator A or B has overflowed

Bit 10 – SAB SA || SB Combined Accumulator 'Sticky' Status bit

Value	Description
1	Accumulator A or B is saturated or has been saturated at some time
0	Neither Accumulator A or B is saturated

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Bit 9 – DA DO Loop Active bit

Value	Description
1	DO loop is in progress
0	DO loop is not in progress

Bit 8 – DC MCU ALU Half Carry/$\overline{\text{Borrow}}$ bit

Value	Description
1	A carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred
0	No carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred

Bits 7:5 – IPL[2:0] CPU Interrupt Priority Level Status bits(1,2)

Value	Description
111	CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
110	CPU Interrupt Priority Level is 6 (14)
101	CPU Interrupt Priority Level is 5 (13)
100	CPU Interrupt Priority Level is 4 (12)
011	CPU Interrupt Priority Level is 3 (11)
010	CPU Interrupt Priority Level is 2 (10)
001	CPU Interrupt Priority Level is 1 (9)
000	CPU Interrupt Priority Level is 0 (8)

Bit 4 – RA REPEAT Loop Active bit

Value	Description
1	REPEAT loop is in progress
0	REPEAT loop is not in progress

Bit 3 – N MCU ALU Negative bit

Value	Description
1	Result was negative
0	Result was non-negative (zero or positive)

Bit 2 – OV MCU ALU Overflow bit

This bit is used for signed arithmetic (two's complement). It indicates an overflow of the magnitude that causes the sign bit to change state.

Value	Description
1	Overflow occurred for signed arithmetic (in this arithmetic operation)
0	No overflow occurred

Bit 1 – Z MCU ALU Zero bit

Value	Description
1	An operation that affects the Z bit has set it at some time in the past
0	The most recent operation that affects the Z bit has cleared it (i.e., a non-zero result)

Bit 0 – C MCU ALU Carry/$\overline{\text{Borrow}}$ bit

Value	Description
1	A carry-out from the Most Significant bit of the result occurred
0	No carry-out from the Most Significant bit of the result occurred

3.6 Arithmetic Logic Unit (ALU)

The dsPIC33CK1024MP710 family ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the *"16-Bit MCU and DSC Programmer's Reference Manual"* (www.microchip.com/DS70000157) for information on the SR bits affected by each instruction.

The core CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

3.6.1 Multiplier

Using the high-speed, 17-bit x 17-bit multiplier, the ALU supports an unsigned, signed or mixed-sign operation in several MCU Multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit signed x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

3.6.2 Divider

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 32-bit signed/16-bit signed divide
- 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The 16-bit signed and unsigned `DIV` instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute. There are additional instructions: `DIV2` and `DIVF2`. Divide instructions will complete in six cycles.

3.7 DSP Engine

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a 40-bit barrel shifter and a 40-bit adder/subtracter (with two target accumulators, round and saturation logic).

The DSP engine can also perform inherent accumulator-to-accumulator operations that require no additional data. These instructions are: `ADD`, `SUB`, `NEG`, `MIN` and `MAX`.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- Fractional or integer DSP multiply (IF)
- Signed, unsigned or mixed-sign DSP multiply (USx)
- Conventional or convergent rounding (RND)
- Automatic saturation on/off for ACCA (SATA)
- Automatic saturation on/off for ACCB (SATB)
- Automatic saturation on/off for writes to data memory (SATDW)
- Accumulator Saturation mode selection (ACCSAT)

4. Memory Organization

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"dsPIC33/PIC24 Program Memory"** (www.microchip.com/DS70000613).

The dsPIC33CK1024MP710 family architecture features separate program and data memory spaces, and buses. This architecture also allows the direct access of program memory from the Data Space (DS) during code execution.

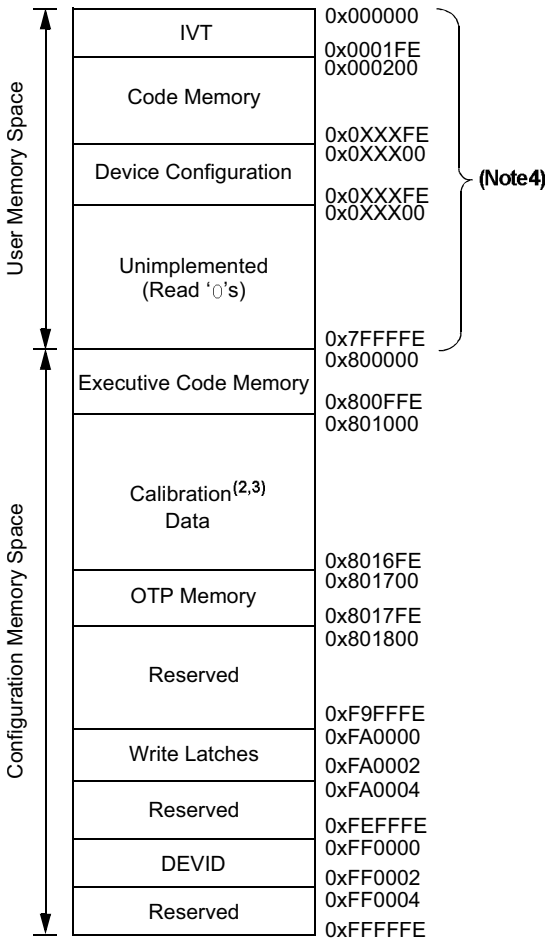

4.1 Program Address Space

The program address memory space of the dsPIC33CK1024MP710 family devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit PC during program execution or from table operation or Data Space remapping, as described in 4.4.5. Interfacing Program and Data Memory Spaces.

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFF). The exception is the use of TBLRD operations, which use TBLPAG[7] to permit access to calibration data and Device ID sections of the configuration memory space.

The program memory maps for dsPIC33CK1024MP710 devices are shown in Figure 4-1.

4.1.1 Program Memory Organization

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (4.1.2. Interrupt and Trap Vectors).

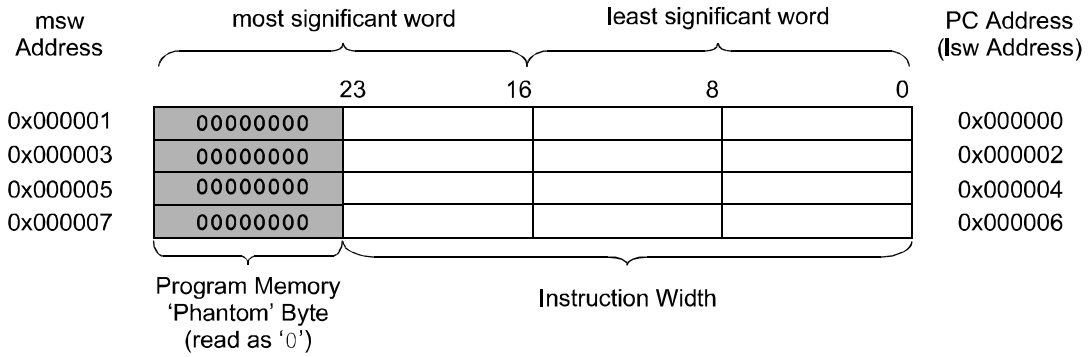

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented, by two, during code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

4.1.2 Interrupt and Trap Vectors

All dsPIC33CK1024MP710 family devices reserve addresses between 0x000000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at address 0x000000 of Flash memory, with the actual address for the start of code at address 0x000002 of Flash memory.

A more detailed discussion of the Interrupt Vector Tables (IVTs) is provided in 7. Interrupt Controller.

Figure 4-5. Program Memory Organization

© 2022-2023 Microchip Technology Inc. and its subsidiaries

4.1.3 Unique Device Identifier (UDID)

All dsPIC33CK1024MP710 family devices are individually encoded during final manufacturing with a Unique Device Identifier (UDID). The UDID cannot be erased by a bulk erase command or any other user-accessible means. This feature allows for manufacturing traceability of Microchip Technology devices in applications where this is a requirement. It may also be used by the application manufacturer for any number of things that may require unique identification, such as:

- Tracking the device
- Unique identifying number
- Unique security key

The UDID comprises five 24-bit program words. When taken together, these fields form a unique 120-bit identifier.

The UDID is stored in five read-only locations, located between 0x801200 and 0x801208 in the device configuration space. Table 4-1 lists the addresses of the identifier words and shows their contents.

Table 4-1. UDID Addresses

UDID	Address	Description
UDID1	0x801200	UDID Word 1
UDID2	0x801202	UDID Word 2
UDID3	0x801204	UDID Word 3
UDID4	0x801206	UDID Word 4
UDID5	0x801208	UDID Word 5

4.2 Data Address Space

The dsPIC33CK1024MP710 family CPU has a separate 16-bit wide data memory space. The Data Space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory map is shown in Figure 4-6.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the Data Space. This arrangement gives a base Data Space address range of 64 Kbytes or 32K words.

The lower half of the data memory space (i.e., when EA[15] = 0) is used for implemented memory addresses, while the upper half (EA[15] = 1) is reserved for the Program Space Visibility (PSV).

The dsPIC33CK1024MP710 family devices implement up to 128 Kbytes of data memory. If an EA points to a location outside of this area, an all-zero word or byte is returned.

4.2.1 Data Memory Organization and Alignment

To maintain backward compatibility with PIC® MCU devices and improve Data Space memory usage efficiency, the dsPIC33CK1024MP710 family instruction set supports both word and byte operations. As a consequence of byte accessibility, all Effective Address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] results in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

A data byte read reads the complete word that contains the byte using the LSb of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel, byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the error occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

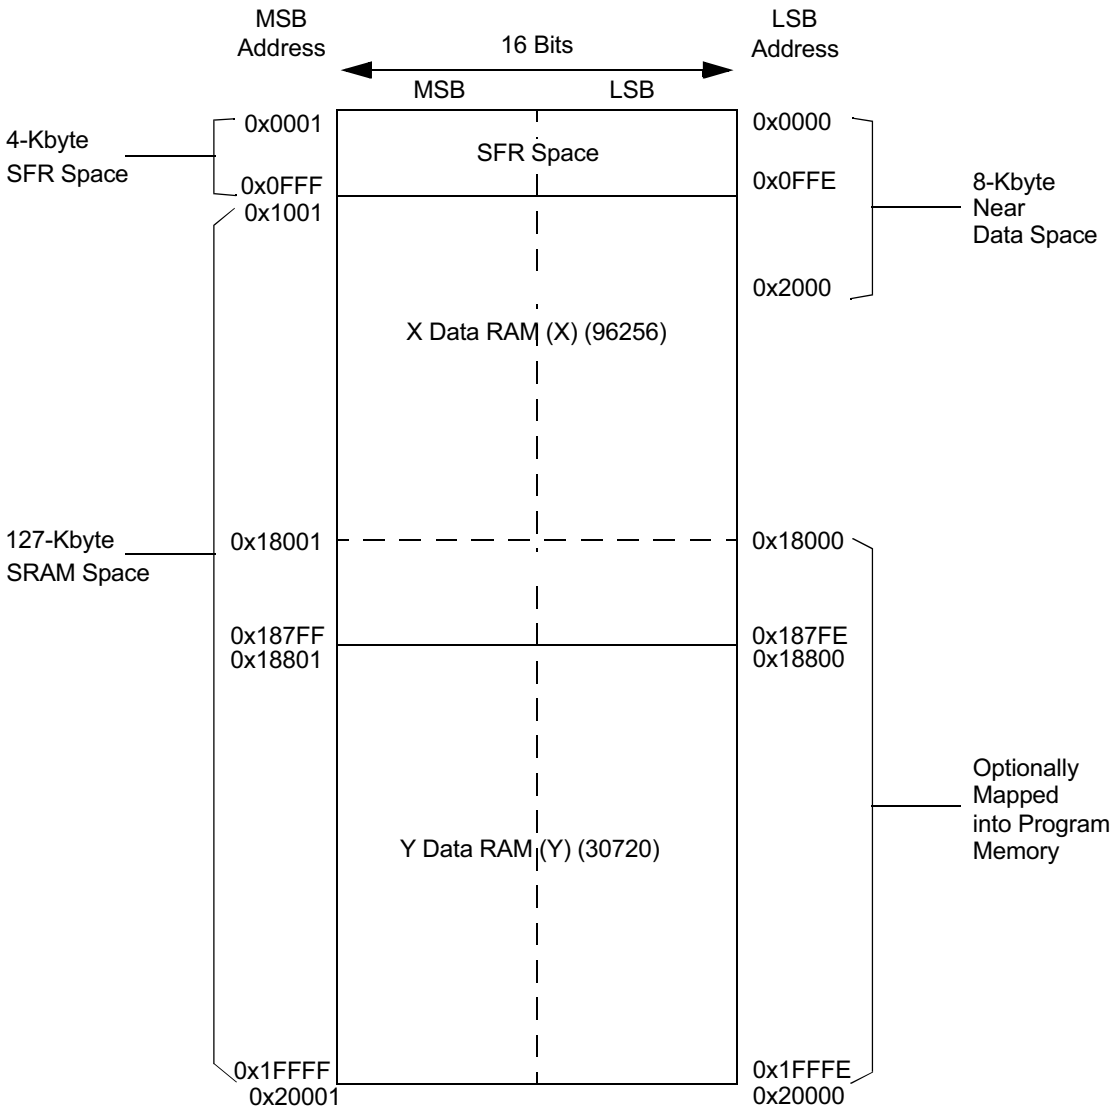

All byte loads into any W register are loaded into the LSB; the MSB is not modified.

A Sign-Extend (SE) instruction is provided to allow user applications to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a Zero-Extend (ZE) instruction on the appropriate address.

4.2.2 Near Data Space

The 8-Kbyte area, between 0x0000 and 0x1FFF, is referred to as the Near Data Space. Locations in this space are directly addressable through a 13-bit absolute address field within all memory direct instructions. Additionally, the whole Data Space is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a Working register as an Address Pointer.

Figure 4-6. Data Memory Map for dsPIC33CKXXXXMPXXX Devices

Note: Memory areas are not shown to scale.

4.2.3 X and Y Data Spaces

The dsPIC33CK1024MP710 family core has two Data Spaces, X and Y. These Data Spaces can be considered either separate (for some DSP instructions) or as one unified linear address range (for MCU instructions). The Data Spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain

© 2022-2023 Microchip Technology Inc. and its subsidiaries

instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms, such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X Data Space is used by all instructions and supports all addressing modes. X Data Space has separate read and write data buses. The X read data bus is the read data path for all instructions that view Data Space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y Data Space is used in concert with the X Data Space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y Data Spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X Data Space.

All data memory writes, including in DSP instructions, view Data Space as combined X and Y address space. The boundary between the X and Y Data Spaces is device-dependent and is not user-programmable.

4.3 BIST Overview

The dsPIC33CK1024MP710 family features a data memory Built-In Self-Test (BIST) that has the option to be run at start-up or run time. The memory test checks that all memory locations are functional and provides a pass/fail status of the RAM that can be used by software to take action if needed. If a failure is reported, the specific location(s) are not identified.

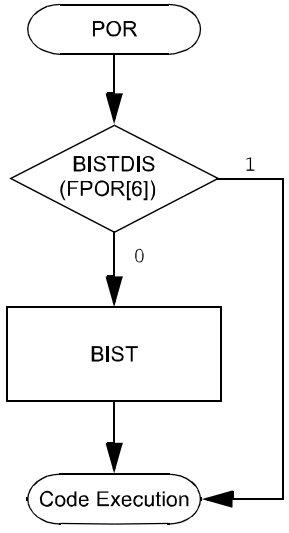

The MBISTCON register (4.3.4. MBISTCON) contains control and status bits for BIST operation. The MBISTDONE bit (MBISTCON[7]) indicates if a BIST was run since the last Reset and the MBISTSTAT bit (MBISTCON[4]) provides the pass/fail result.

BIST will always run on FRC+PLL with PLL settings resulting in a 125 MHz clock rate.

4.3.1 BIST at Start-up

The BIST can be configured to automatically run on a POR-type Reset, as shown in Figure 4-7. By default, when BISTDIS (FPOR[6]) = 1, the BIST is disabled and will not be part of device start-up. If the BISTDIS bit is cleared during device programming, the BIST will run after all Configuration registers have been loaded and before code execution begins.

4.3.2 Fault Simulation

A mechanism is available to simulate a BIST failure to allow testing of Fault handling software. When the FLTINJ bit is set during a run-time BIST, the MBISTSTAT bit will be set regardless of the test result. The procedure for a BIST Fault simulation is as follows:

1. Execute the unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
2. Set the MBISTEN bit (MBISTCON[0]).
3. Execute 2nd unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
4. Set the FLTINJ bit (MBISTCON[8]).
5. Execute a Software Reset command.
6. Verify a Software Reset has occurred by reading SWR (RCON[6]) (optional).
7. Verify the MBISTDONE, MBSITSTAT and FLTINJ bits are all set.

4.3.3 BIST at Run Time

The BIST can also be run at any time during code execution. Note that a BIST will corrupt all of the RAM contents, including the Stack Pointer, and requires a subsequent Reset. The system should be prepared for a Reset before a BIST is performed. The BIST is invoked by setting the MBISTEN bit (MBISTCON[0]). The MBISTCON register is protected against accidental writes and requires an unlock sequence prior to writing. Only one bit can be set per unlock sequence. The procedure for a run-time BIST is as follows:

1. Execute the unlock sequence by consecutively writing 0x55 and 0xAA to the NVMKEY register.
2. Write 0x0001 to the MBISTCON SFR.
3. Execute a Software Reset command.
4. Verify a Software Reset has occurred by reading SWR (RCON[6]) (optional).
5. Verify that the MBISTDONE bit is set.
6. Take action depending on test result indicated by MBISTSTAT.

Bit 8 – FLTINJ MBIST Fault Inject Control bit(1)

Value	Description
1	The MBIST test will complete and sets MBISTSTAT = 1, simulating an SRAM test failure
0	The MBIST test will execute normally

Bit 7 – MBISTDONE MBIST Done Status bit

Value	Description
1	An MBIST operation has been executed
0	No MBIST operation has occurred on the last Reset sequence

Bit 4 – MBISTSTAT MBIST Status bit

Value	Description
1	The last MBIST failed
0	The last MBIST passed; all memory may not have been tested

Bit 0 – MBISTEN MBIST Enable bit(2)

Value	Description
1	MBIST test is armed; an MBIST test will execute at the next device Reset
0	MBIST test is disarmed

4.4 Memory Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

4.4.1 Paged Memory Scheme

The dsPIC33CK1024MP710 architecture extends the available Data Space through a paging scheme, which allows the available Data Space to be accessed using MOV instructions in a linear fashion for pre-modified and post-modified Effective Addresses (EAs). The upper half of the base Data Space address is used in conjunction with the Data Space Read Page (DSRPAG) register to form the Program Space Visibility (PSV) address.

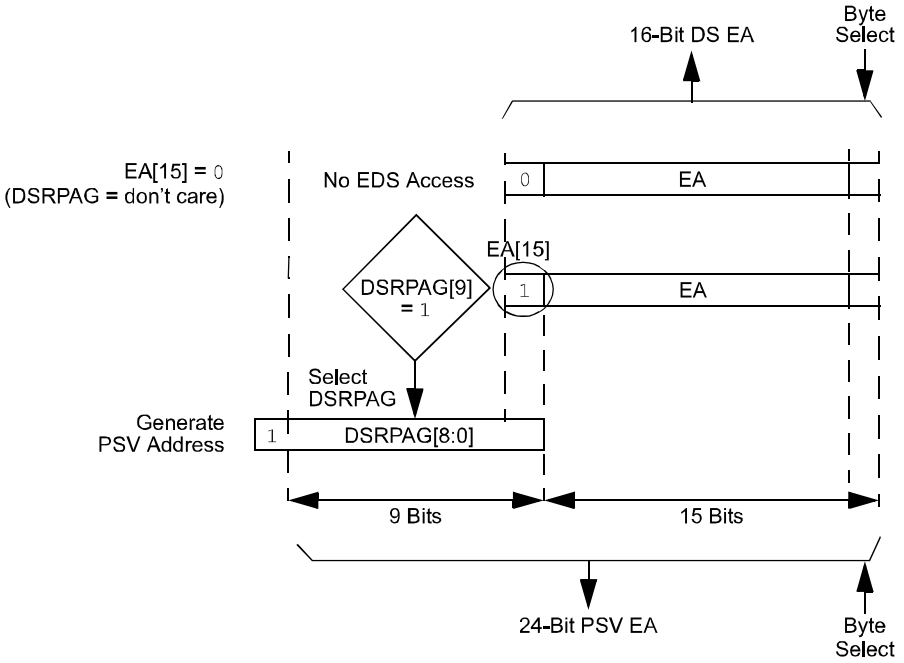

The DSRPAG register is located in the SFR space. When DSRPAG[9] = 1 and the base address bit EA[15] = 1, the DSRPAG[8:0] bits are concatenated onto EA[14:0] to form the 24-bit PSV read address.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

The paged memory scheme provides access to multiple 32-Kbyte windows in the PSV memory. The DSRPAG register, in combination with the upper half of the Data Space address, can provide up to 8 Mbytes of PSV address space. The paged data memory space is shown in Figure 4-9.

The Program Space (PS) can be accessed with a DSRPAG of 0x200 or greater. Only reads from PS are supported using the DSRPAG.

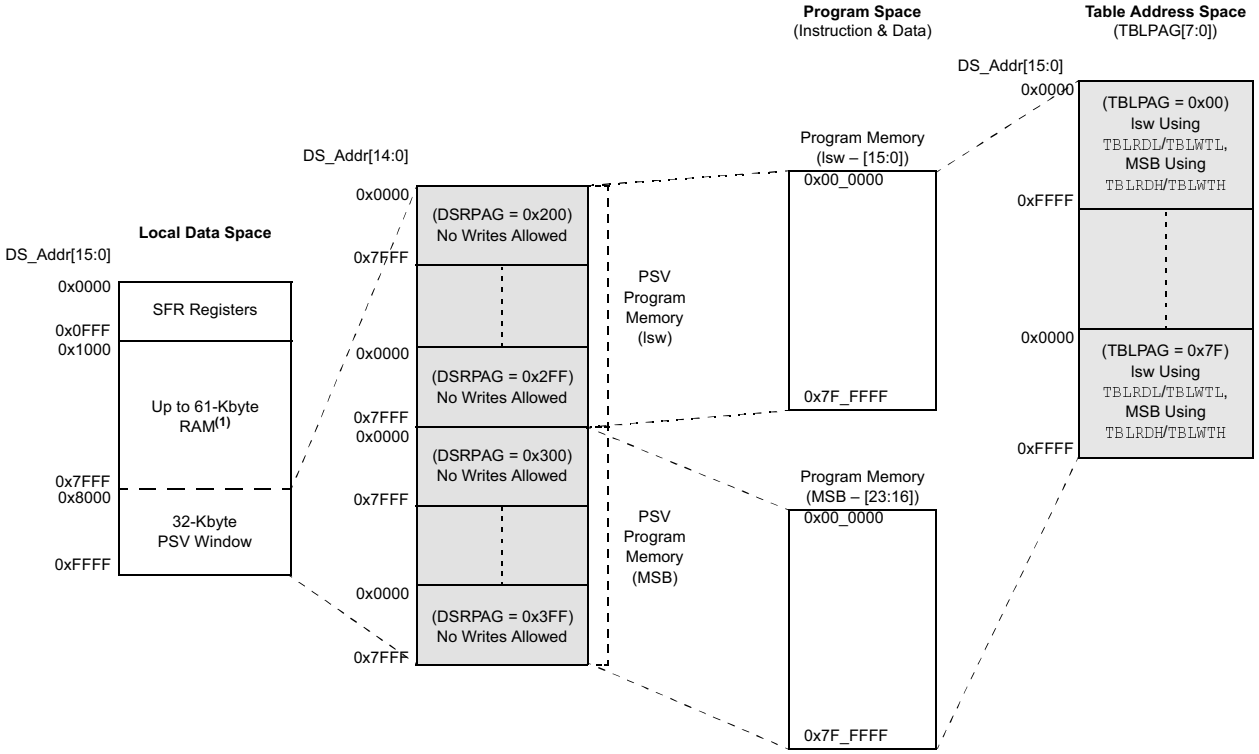

Figure 4-8. Program Space Visibility (PSV) Read Address Generation

Note: DS read access when DSRPAG = 0x000 will force an address error trap.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Figure 4-9. Paged Data Memory Space

When a PSV page overflow or underflow occurs, EA[15] is cleared as a result of the register indirect EA calculation. An overflow or underflow of the EA in the PSV pages can occur at the page boundaries when:

- The initial address, prior to modification, addresses the PSV page
- The EA calculation uses Pre-Modified or Post-Modified Register Indirect Addressing; however, this does not include Register Offset Addressing

In general, when an overflow is detected, the DSRPAG register is incremented and the EA[15] bit is set to keep the base address within the PSV window. When an underflow is detected, the DSRPAG register is decremented and the EA[15] bit is set to keep the base address within the PSV window. This creates a linear PSV address space, but only when using Register Indirect Addressing modes.

Exceptions to the operation described above arise when entering and exiting the boundaries of Page 0 and PSV spaces. Table 4-2 lists the effects of overflow and underflow scenarios at different boundaries.

In the following cases, when overflow or underflow occurs, the EA[15] bit is set and the DSRPAG is not modified; therefore, the EA will wrap to the beginning of the current page:

- Register Indirect with Register Offset Addressing
- Modulo Addressing
- Bit-Reversed Addressing

Legend: O = Overflow, U = Underflow, R = Read, W = Write

Notes:

1. The Register Indirect Addressing now addresses a location in the base Data Space (0x0000-0x8000).
2. An EDS access, with DSRPAG = 0x000, will generate an address error trap.
3. Only reads from PS are supported using DSRPAG.
4. Pseudolinear Addressing is not supported for large offsets.

4.4.1.1 Extended X Data Space

The lower portion of the base address space range, between 0x0000 and 0x7FFF, is always accessible, regardless of the contents of the Data Space Read Page register. It is indirectly addressable through the register indirect instructions. It can be regarded as being located in the default EDS Page 0 (i.e., EDS address range of 0x000000 to 0x007FFF with the base address bit, EA[15] = 0, for this address range). However, Page 0 cannot be accessed through the upper 32 Kbytes, 0x8000 to 0xFFFF, of base Data Space in combination with DSRPAG = 0x00. Consequently, DSRPAG is initialized to 0x001 at Reset.

Notes:

1. DSRPAG should not be used to access Page 0. An EDS access with DSRPAG set to 0x000 will generate an address error trap.
2. Clearing the DSRPAG in software has no effect.

The remaining PSV pages are only accessible using the DSRPAG register in combination with the upper 32 Kbytes, 0x8000 to 0xFFFF, of the base address, where the base address bit EA[15] = 1.

4.4.1.2 Software Stack

The W15 register serves as a dedicated Software Stack Pointer (SSP), and is automatically modified by exception processing, subroutine calls and returns; however, W15 can be referenced by any instruction in the same manner as all other W registers. This simplifies reading, writing and manipulating the Stack Pointer (for example, creating stack frames).

Note: To protect against misaligned stack accesses, W15[0] is fixed to '0' by the hardware.

W15 is initialized to 0x1000 during all Resets. This address ensures that the SSP points to valid RAM in all dsPIC33CK1024MP710 devices and permits stack availability for non-maskable trap exceptions. These can occur before the SSP is initialized by the user software. You can reprogram the SSP during initialization to any location within Data Space.

The Software Stack Pointer always points to the first available free word and fills the software stack, working from lower toward higher addresses. Figure 4-10 illustrates how it pre-decrements for a stack pop (read) and post-increments for a stack push (write).

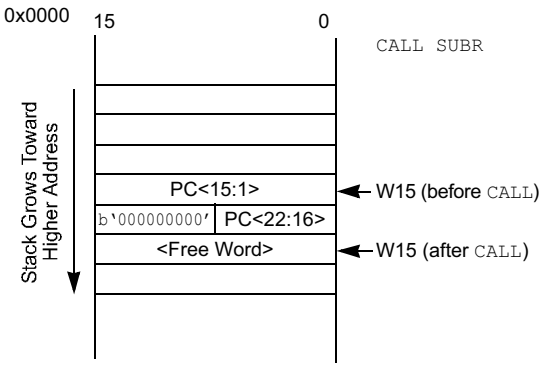

© 2022-2023 Microchip Technology Inc. and its subsidiaries

When the PC is pushed onto the stack, PC[15:0] are pushed onto the first available stack word, then PC[22:16] are pushed into the second available stack location. For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, as shown in Figure 4-10. During exception processing, the MSB of the PC is concatenated with the lower eight bits of the CPU STATUS Register, SR. This allows the contents of SRL to be preserved automatically during interrupt processing.

Notes:

1. To maintain system Stack Pointer (W15) coherency, W15 is never subject to (EDS) paging, and is, therefore, restricted to an address range of 0x0000 to 0xFFFF. The same applies to the W14 when used as a Stack Frame Pointer (SFA = 1).
2. As the stack can be placed in, and can access X and Y spaces, care must be taken regarding its use, particularly with regard to local automatic variables in a C development environment.

Figure 4-10. CALL Stack Frame

4.4.2 Instruction Addressing Modes

The addressing modes shown in Table 4-3 form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions differ from those in the other instruction types.

Table 4-3. Fundamental Addressing Modes Supported

Addressing Mode	Description
File Register Direct	The address of the file register is specified explicitly.
Register Direct	The contents of a register are accessed directly.
Register Indirect	The contents of Wn form the Effective Address (EA).
Register Indirect Post-Modified	The contents of Wn form the EA. Wn is post-modified (incremented or decremented) by a constant value.
Register Indirect Pre-Modified	Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.
Register Indirect with Register Offset (Register Indexed)	The sum of Wn and Wb forms the EA.
Register Indirect with Literal Offset	The sum of Wn and a literal forms the EA.

4.4.2.1 File Registration Instructions

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a Working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire Data Space.

4.4.2.2 MCU Instructions

The three-operand MCU instructions are of the form:

© 2022-2023 Microchip Technology Inc. and its subsidiaries

```
Operand 3 = Operand 1 [function] Operand 2
```

where Operand 1 is always a Working register (that is, the addressing mode can only be Register Direct), which is referred to as Wb. Operand 2 can be a W register fetched from data memory or a 5-bit literal. The result location can either be a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-Bit or 10-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

4.4.2.3 Move and Accumulator Instructions

Move instructions, and the DSP accumulator class of instructions, provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.4.2.4 MAC Instructions

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY.N, MOVSAC and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must therefore, be valid addresses within X Data Space for W8 and W9, and Y Data Space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

© 2022-2023 Microchip Technology Inc. and its subsidiaries

In summary, the following addressing modes are supported by the MAC class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.4.2.5 Other Instructions

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ULNK, the source of an operand or result is implied by the opcode itself. Certain operations, such as a NOP, do not have any operands.

4.4.3 Modulo Addressing

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either Data or Program Space (since the Data Pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into Program Space) and Y Data Spaces. Modulo Addressing can operate on any W Register Pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction, as there are certain restrictions on the buffer start address (for incrementing buffers) or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a Bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

4.4.3.1 Start and End Address

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND.

Note: Y space Modulo Addressing EA calculations assume word-sized data (LSb of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

4.4.3.2 W Address Register Selection

The Modulo and Bit-Reversed Addressing Control register, MODCON[15:0], contains enable flags, as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that operate with Modulo Addressing:

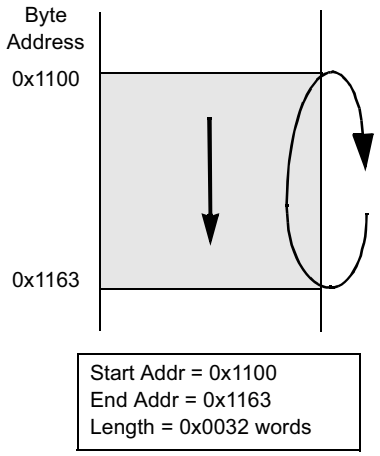

- If XWM = 1111, X RAGU and X WAGU Modulo Addressing is disabled
- If YWM = 1111, Y AGU Modulo Addressing is disabled

The X Address Space Pointer W (XWM) register, to which Modulo Addressing is to be applied, is stored in MODCON[3:0]. Modulo Addressing is enabled for X Data Space when XWM is set to any value other than '1111' and the XMODEN bit is set (MODCON[15]).

The Y Address Space Pointer W (YWM) register, to which Modulo Addressing is to be applied, is stored in MODCON[7:4]. Modulo Addressing is enabled for Y Data Space when YWM is set to any value other than '1111' and the YMODEN bit is set (MODCON[14]).

MOV     W0, [W1++]      ;fill the next location
AGAIN:  INC W0, W0      ;increment the fill value
```

4.4.4 Bit-Reversed Addressing

Bit-Reversed Addressing mode is intended to simplify data reordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

4.4.4.1 Bit-Reversed Addressing Implementation

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWMx bits (W register selection) in the MODCON register are any value other than '1111' (the stack cannot be accessed using Bit-Reversed Addressing)
- The BREN bit is set in the XBREV register
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment

If the length of a bit-reversed buffer is $M = 2^N$ bytes, the last 'N' bits of the data buffer start address must be zeros.

The XB[14:0] bits are the Bit-Reversed Addressing modifier, or 'pivot point', which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note: All bit-reversed EA calculations assume word-sized data (LSb of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word-sized data writes. It does not function for any other addressing mode or for byte-sized data, and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB) and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word-sized data are a requirement, the LSb of the EA is ignored (and always clear).

Note: Modulo Addressing and Bit-Reversed Addressing can be enabled simultaneously using the same W register, but the Bit-Reversed Addressing operation will always take precedence for data writes when enabled.

If Bit-Reversed Addressing has already been enabled by setting the BREN (XBREV[15]) bit, a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the Bit-Reversed Pointer.

4.4.5 Interfacing Program and Data Memory Spaces

The dsPIC33CK1024MP710 family architecture uses a 24-bit wide Program Space (PS) and a 16-bit wide Data Space (DS). The architecture is also a modified Harvard scheme, meaning that data can also be present in the Program Space. To use these data successfully, they must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the architecture of the dsPIC33CK1024MP710 family devices provides two methods by which Program Space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the Program Space
- Remapping a portion of the Program Space into the Data Space (Program Space Visibility)

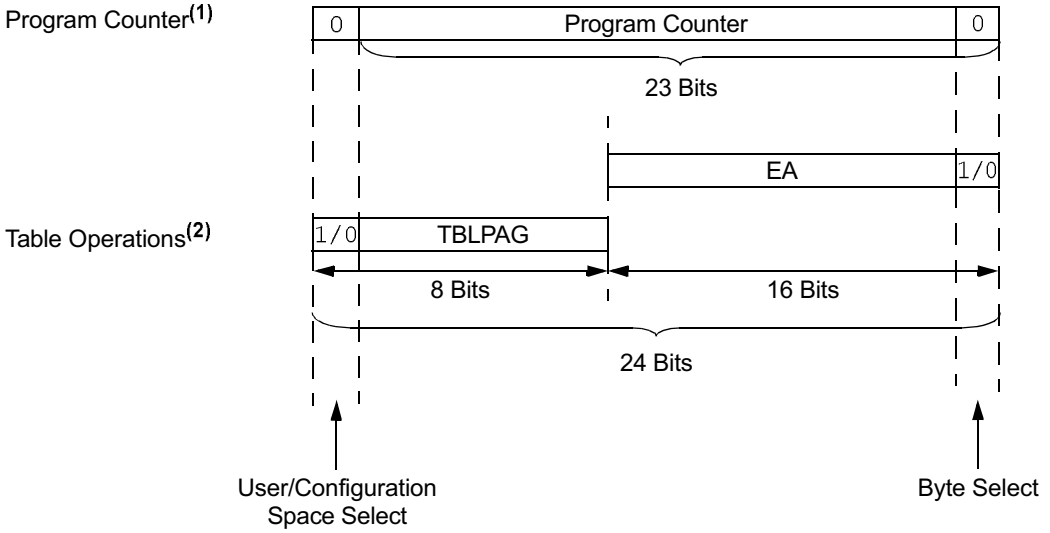

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look ups from a large table of static data. The application can only access the least significant word of the program word.

Table 4-5. Program Space Address Construction

Access Type	Access Space	Program Space Address				
		[23]	[22:16]	[15]	[14:1]	[0]

		0xxx xxxx xxxx xxxx xxxx xxxx

		1xxx xxxx xxxx xxxx xxxx xxxx				

Figure 4-13. Data Access from Program Space Address Generation

Note 1: The Least Significant bit (LSb) of Program Space addresses is always fixed as '0' to maintain word alignment of data in the Program and Data Spaces.

2: Table operations are not required to be word-aligned. Table Read operations are permitted in the configuration memory space.

4.4.5.1 Data Access from Program Memory Using Table Instructions

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the Program Space without going through Data Space. The TBLRDH and TBLWTH instructions are the only method to read or write the upper eight bits of a Program Space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two 16-bit wide word address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space that contains the least significant data word. TBLRDH and TBLWTH access the space that contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from Program Space. Both function as either byte or word operations.

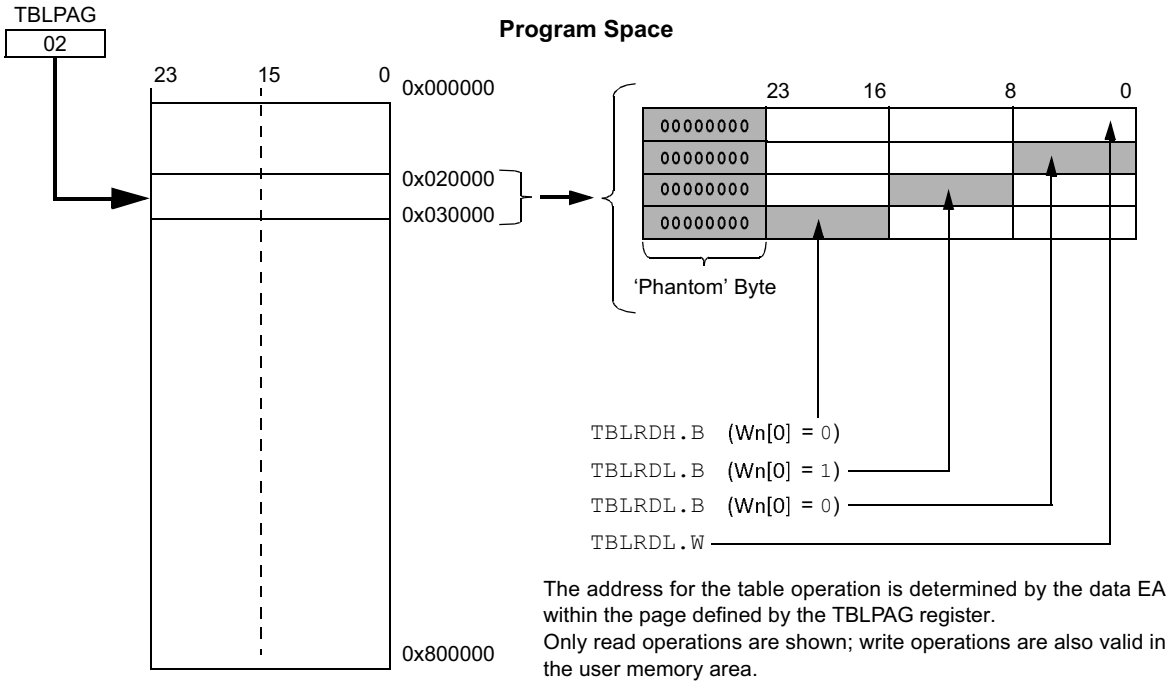

© 2022-2023 Microchip Technology Inc. and its subsidiaries

- TBLRDL (Table Read Low):
  - In Word mode, this instruction maps the lower word of the Program Space location (P[15:0]) to a data address (D[15:0]).
  - In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.
- TBLRDH (Table Read High):
  - In Word mode, this instruction maps the entire upper word of a program address (P[23:16]) to a data address. The 'phantom' byte (D[15:8]) is always '0'.
  - In Byte mode, this instruction maps the upper or lower byte of the program word to D[7:0] of the data address in the TBLRDL instruction. The data are always '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a Program Space address. The details of their operation are explained in 5. Flash Program Memory.

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user application and configuration spaces. When TBLPAG[7] = 0, the table page is located in the user memory space. When TBLPAG[7] = 1, the page is located in configuration space.

5. Flash Program Memory

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Dual Partition Flash Program Memory"** (www.microchip.com/DS70005156).

Some registers and associated bits described in this section may not be available on all devices.

The dsPIC33CK1024MP710 family devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire V_{DD} range.

Flash memory can be programmed in three ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)
- Run-Time Self-Programming (RTSP)

ICSP allows for a dsPIC33CK1024MP710 family device to be serially programmed while in the end application circuit. This is done with a Programming Clock and Programming Data (PGCx/PGDx) line, and three other lines for power (V_{DD}), ground (V_{SS}) and Master Clear ($\overline{MCLR}$). This allows customers to manufacture boards with unprogrammed devices and then program the device just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

Enhanced In-Circuit Serial Programming uses an on-board bootloader, known as the Program Executive, to manage the programming process. Using an SPI data frame format, the Program Executive can erase, program and verify program memory. For more information on Enhanced ICSP, see the device programming specification.

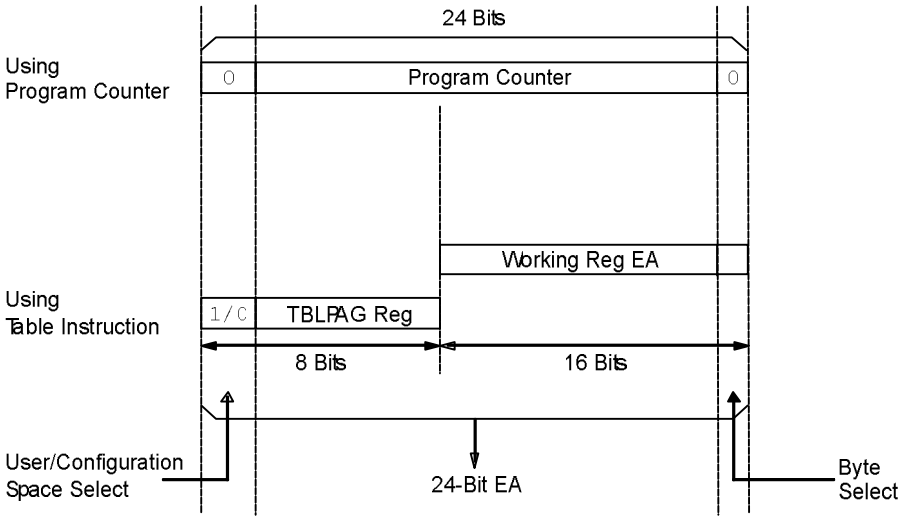

RTSP allows the Flash user application code to update itself during run time. The feature is capable of writing a single program memory word (two instructions) or an entire row as needed.

5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the Table Read and Table Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits[7:0] of the TBLPAG register and the Effective Address (EA) from a W register, specified in the table instruction, as shown in Figure 5-1. The `TBLRDL` and `TBLWTL` instructions are used to read or write to bits[15:0] of program memory. `TBLRDL` and `TBLWTL` can access program memory in both Word and Byte modes. The `TBLRDH` and `TBLWTH` instructions are used to read or write to bits[23:16] of program memory. `TBLRDH` and `TBLWTH` can also access program memory in Word or Byte mode.

Figure 5-1. Addressing for Table Registers

5.2 RTSP Operation

RTSP allows the user application to program one double instruction word or one row at a time. The double instruction word write blocks and single row write blocks are edge-aligned, from the beginning of program memory, on boundaries of one double instruction word and 64 double instruction words, respectively.

The basic sequence for RTSP programming is to first load two 24-bit instructions into the NVM write latches found in configuration memory space. Then, the WR bit in the NVMCON register is set to initiate the write process. The processor stalls (waits) until the programming operation is finished. The WR bit is automatically cleared when the operation is finished.

Double instruction word writes are performed by manually loading both write latches, using `TBLWTL` and `TBLWTH` instructions, and then initiating the NVM write while the NVMOPx bits are set to '`0x1`'. The Program Space destination address is defined by the NVMADR/U registers.

Row programming is performed by first loading 128 instructions into data RAM and then loading the address of the first instruction in that row into the NVMSRCADRL/H registers. Once the write has been initiated, the device will automatically load two instructions into the write latches and write them to the Program Space destination address defined by the NVMADR/U registers.

The operation will increment the NVMSRCADRL/H and the NVMADR/U registers until all double instruction words have been programmed.

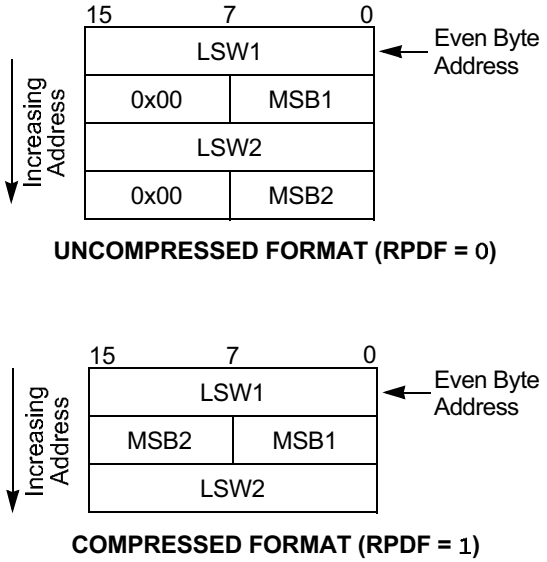

The RPDF bit (NVMCON[9]) selects the format of the stored data in RAM to be either compressed or uncompressed. See Figure 5-2 for data formatting.

Compressed data help to reduce the amount of required RAM by using the upper byte of the second word for the MSB of the second instruction.

All erase and program operations may optionally use the NVM interrupt to signal the successful completion of the operation.

5.3 Error Correcting Code (ECC)

In order to improve program memory performance and durability, the devices include Error Correcting Code functionality (ECC) as an integral part of the Flash memory controller. ECC can determine the presence of single-bit errors in program data, including which bit is in error, and correct the data automatically without user intervention. ECC cannot be disabled.

When data are written to program memory, ECC generates a 7-bit Hamming code parity value for every two (24-bit) instruction words. The data are stored in blocks of 48 data bits and seven parity bits; parity data are not memory-mapped and are inaccessible. When the data are read back, the ECC calculates the parity on them and compares it to the previously stored parity value. If a parity mismatch occurs, there are two possible outcomes:

- Single-bit error has occurred and has been automatically corrected on read-back.
- Double-bit error has occurred and the read data are not changed.

Single-bit error occurrence can be identified by the state of the ECCSBEIF (IFS0[13]) bit. An interrupt can be generated when the corresponding interrupt enable bit is set, ECCSBEIE (IEC0[13]). The ECCSTATL register contains the parity information for single-bit errors. The SECOUT[7:0] bit field contains the expected calculated SEC parity and SECIN[7:0] bits contain the actual value from a Flash read operation. The SECSYNDx bits (ECCSTATH[7:0]) indicate the bit position of the single-bit error within the 48-bit pair of instruction words. When no error is present, SECINx equals SECOUTx and SECSYNDx is zero.

Double-bit errors result in a generic hard trap. The ECCDBE bit (INTCON4[1]) will be set to identify the source of the hard trap. If no Interrupt Service Routine is implemented for the hard trap, a device Reset will also occur. The ECCSTATH register contains double-bit error status information. The DEDOUT bit is the expected calculated DED parity and DEDIN is the actual value from a Flash read operation. When no error is present, DEDIN equals DEDOUT.

5.4 ECC Fault Injection

To test Fault handling, an EEC error can be generated. Both single and double-bit errors can be generated in both the read and write data paths. Read path Fault injection first reads the Flash data and then modifies them prior to entering the ECC logic. Write path Fault injection modifies the actual data prior to them being written into the target Flash and will cause an EEC error on a subsequent Flash read. The following procedure is used to inject a Fault:

1. Load the Flash target address into the ECCADDR register.
2. Select 1st Fault bit determined by FLT1PTRx (ECCCONH[7:0]). The target bit is inverted to create the Fault.
3. If a double Fault is desired, select the 2nd Fault bit determined by FLT2PTRx (ECCCONH[15:8]); otherwise, set to all '1's.
4. Write 0x55 to NVMKEY.
5. Write 0xAA to NVMKEY.
6. Set the FLTINJ bit (ECCCONL[0]) in a single operation to enable the ECC Fault injection logic.
7. Perform a read or write to the Flash target address.

5.5 Flash OTP by ICSP™ Write Inhibit

ICSP Write Inhibit is an access restriction feature, that when activated, restricts all of Flash memory. Once activated, ICSP Write Inhibit permanently prevents ICSP Flash programming and erase operations, and cannot be deactivated. This feature is intended to prevent alteration of Flash memory contents, with behavior similar to One-Time-Programmable (OTP) devices.

RTSP, including erase and programming operations, is not restricted when ICSP Write Inhibit is activated; however, code to perform these actions must be programmed into the device before ICSP Write Inhibit is activated. This allows for a bootloader-type application to alter Flash contents with ICSP Write Inhibit activated.

Entry into ICSP and Enhanced ICSP modes is not affected by ICSP Write Inhibit. In these modes, it will continue to be possible to read configuration memory space and any user memory space regions which are not code-protected. With ICSP writes inhibited, an attempt to set WR (NVMCON[15]) = 1 will maintain WR = 0, and instead, set WRERR (NVMCON[13]) = 1. All Enhanced ICSP erase and programming commands will have no effect with

© 2022-2023 Microchip Technology Inc. and its subsidiaries

self-checked programming commands returning a FAIL response opcode (PASS if the destination already exactly matched the requested programming data).

Once ICSP Write Inhibit is activated, it is not possible for a device executing in Debug mode to erase/write Flash, nor can a debug tool switch the device to Production mode. ICSP Write Inhibit should therefore only be activated on devices programmed for production.

5.6 Dual Partition Flash Configuration

For dsPIC33CK1024MP710 devices operating in Dual Partition Flash Program Memory modes, the Inactive Partition can be erased and programmed without stalling the processor. The same programming algorithms are used for programming and erasing the Flash in the Inactive Partition, as described in 5.2. RTSP Operation. On top of the page erase option, the entire Flash memory of the Inactive Partition can be erased by configuring the NVMOP[3:0] bits in the NVMCON register.

Note: The application software to be loaded into the Inactive Partition will have the address of the Active Partition. The bootloader firmware will need to offset the address by 0x400000 in order to write to the Inactive Partition.

5.6.1 Flash Partition Swapping

The Boot Sequence Number is used for determining the Active Partition at start-up and is encoded within the FBTSEQ Configuration register bits. Unlike most Configuration registers, which only utilize the lower 16 bits of the program memory, FBTSEQ is a 24-bit Configuration Word. The Boot Sequence Number (BSEQ) is a 12-bit value and is stored in FBTSEQ twice. The true value is stored in bits, FBTSEQ[11:0], and its complement is stored in bits, FBTSEQ[23:12]. Should a Boot sequence number be invalid (or unprogrammed), it will be overridden to value 0x000FFF prior to analysis (i.e., the highest possible Boot sequence number). The FC will then compare the Boot sequence numbers and make the panel with the lowest Boot sequence number the Active panel. If both Boot sequence numbers are equal (which will also occur if they are both invalid), the FC will select the default panel (Panel 1) to be the Active Boot region. Should either or both Boot sequence number reads result in an ECC DED error, an ECC DERR trap will requested, otherwise no notification is issued for equal Boot sequence numbers (because this is typically not a run-time error). See 30. Special Features for more information.

The `BOOTSWP` instruction provides an alternative means of swapping the Active and Inactive Partitions (soft swap) without the need for a device Reset. The `BOOTSWP` must always be followed by a `GOTO` instruction. The `BOOTSWP` instruction swaps the Active and Inactive Partitions, and the PC vectors to the location specified by the `GOTO` instruction in the newly Active Partition.

It is important to note that interrupts should temporarily be disabled while performing the soft swap sequence and that after the partition swap, all peripherals and interrupts, which were enabled, remain enabled. Additionally, the RAM and stack will maintain state after the switch. As a result, it is recommended that applications using soft swaps jump to a routine that will reinitialize the device in order to ensure the firmware runs as expected. The Configuration registers will have no effect during a soft swap.

For robustness of operation, in order to execute the `BOOTSWP` instruction, it is necessary to execute the NVM unlocking sequence as follows:

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Execute the `BOOTSWP` instruction.

If the unlocking sequence is not performed, the `BOOTSWP` instruction will be executed as a forced `NOP` and a `GOTO` instruction, following the `BOOTSWP` instruction, will be executed, causing the PC to jump to that location in the current operating partition.

The SFTSWP and P2ACTIV bits in the NVMCON register are used to determine a successful swap of the Active and Inactive Partitions, as well as which partition is active. After the `BOOTSWP` and `GOTO` instructions, the SFTSWP bit should be polled to verify the partition swap has occurred and then cleared for the next panel swap event.

5.6.2 Dual Partition Modes

While operating in Dual Partition mode, the dsPIC33CK1024MP710 family devices have the option for both partitions to have their own defined security segments, as shown in 30.10. Code Protection and CodeGuard™ Security**.** Alternatively, the device can operate in Protected Dual Partition mode, where Partition 1 becomes permanently erase/write-protected. Protected Dual Partition mode allows for a “Factory Default” mode, which provides a fail-safe backup image to be stored in Partition 1.

dsPIC33CK1024MP710 family devices can also operate in Privileged Dual Partition mode, where additional security protections are implemented to allow for protection of intellectual property when multiple parties have software within the device. In Privileged Dual Partition mode, both partitions place additional restrictions on the FBSLIM register. These prevent changes to the size of the Boot Segment and General Segment, ensuring that neither segment will be altered.

5.7.1 Nonvolatile Memory (NVM) Control Register

Name: NVMCON
Offset: 0x8D0

Notes:

1. These bits can only be reset on a POR.
2. If this bit is set, there will be minimal power savings (I_{IDLE}), and upon exiting Idle mode, there is a delay (T_{VREG}) before Flash memory becomes operational.
3. All other combinations of NVMOP[3:0] are unimplemented.
4. Execution of the PWRSAV instruction is ignored while any of the NVM operations are in progress.
5. Two adjacent words on a 4-word boundary are programmed during execution of this operation.

6. Resets

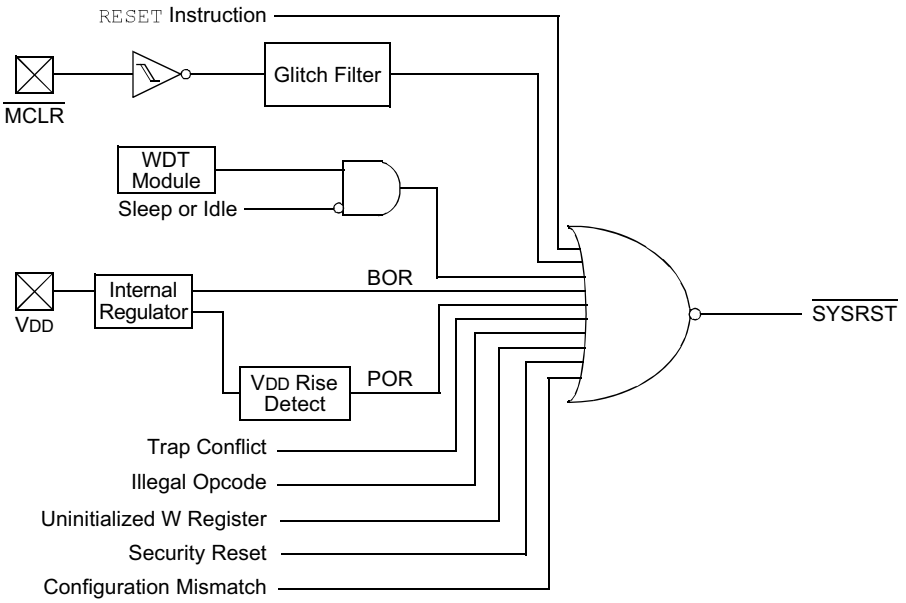

This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Reset"** (www.microchip.com/DS70602).

The Reset module combines all Reset sources and controls the device Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- $\overline{\text{MCLR}}$: Master Clear Pin Reset
- SWR: RESET Instruction
- WDTO: Watchdog Timer Time-out Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
  - Illegal Opcode Reset
  - Uninitialized W Register Reset
  - Security Reset

A simplified block diagram of the Reset module is shown in Figure 6-1.

Figure 6-1. Reset System Block Diagram

Any active source of Reset will make the $\overline{\text{SYSRST}}$ signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state, and some are unaffected.

Note: Refer to the specific peripheral section or 4. Memory Organization of this data sheet for register Reset states.

All types of device Reset set a corresponding status bit in the RCON register to indicate the type of Reset.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

A POR clears all the bits, except for the BOR and POR bits (RCON[1:0]) that are set. The user application can set or clear any bit, at any time, during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device Power-Saving states. The function of these bits is discussed in other sections of this manual.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

For all Resets, the default clock source is determined by the FNOSC[2:0] bits in the FOSCSEL Configuration register. The value of the FNOSCx bits is loaded into the NOSC[2:0] (OSCCON[10:8]) bits on Reset, which in turn, initializes the system clock.

6.1 Reset Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

6.1.2 Reset Control Register

Name: RCON(1)
Offset: 0xF80

Notes:

1. All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.
2. If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

Bit	15	14	13	12	11	10	9	8

Reset	0	0	0	0	0	0	1	1

Bit 15 – TRAPR Trap Reset Flag bit

Value	Description
1	A Trap Conflict Reset has occurred
0	A Trap Conflict Reset has not occurred

Bit 14 – IOPUWR Illegal Opcode or Uninitialized W Register Access Reset Flag bit

Value	Description
1	An Illegal Opcode, an Illegal Address mode or Uninitialized W Register used as an Address Pointer caused a Reset
0	An Illegal Opcode or Uninitialized W Register Reset has not occurred

Bit 9 – CM Configuration Mismatch Flag bit

Value	Description
1	A Configuration Mismatch Reset has occurred
0	A Configuration Mismatch Reset has not occurred

Bit 8 – VREGS Voltage Regulator Standby During Sleep bit

Value	Description
1	Voltage regulator is active during Sleep
0	Voltage regulator goes into Standby mode during Sleep

Bit 7 – EXTR External Reset ($\overline{MCLR}$) Pin bit

Value	Description
1	A Master Clear (pin) Reset has occurred
0	A Master Clear (pin) Reset has not occurred

Bit 6 – SWR Software RESET (Instruction) Flag bit

Value	Description
1	A RESET instruction has been executed
0	A RESET instruction has not been executed

Bit 5 – SWDTEN Software Enable/Disable of WDT bit(2)

Value	Description
1	WDT is enabled
0	WDT is disabled

Bit 4 – WDTO Watchdog Timer Time-out Flag bit

Value	Description
1	WDT time-out has occurred
0	WDT time-out has not occurred

Bit 3 – SLEEP Wake-up from Sleep Flag bit

Value	Description
1	Device has been in Sleep mode
0	Device has not been in Sleep mode

Bit 2 – IDLE Wake-up from Idle Flag bit

Value	Description
1	Device has been in Idle mode
0	Device has not been in Idle mode

Bit 1 – BOR Brown-out Reset Flag bit

Value	Description
1	A Brown-out Reset has occurred
0	A Brown-out Reset has not occurred

Bit 0 – POR Power-on Reset Flag bit

Value	Description
1	A Power-on Reset has occurred
0	A Power-on Reset has not occurred

7. Interrupt Controller

This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Interrupts"** (www.microchip.com/DS70000600).

The dsPIC33CK1024MP710 family interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33CK1024MP710 family CPU.

The interrupt controller has the following features:

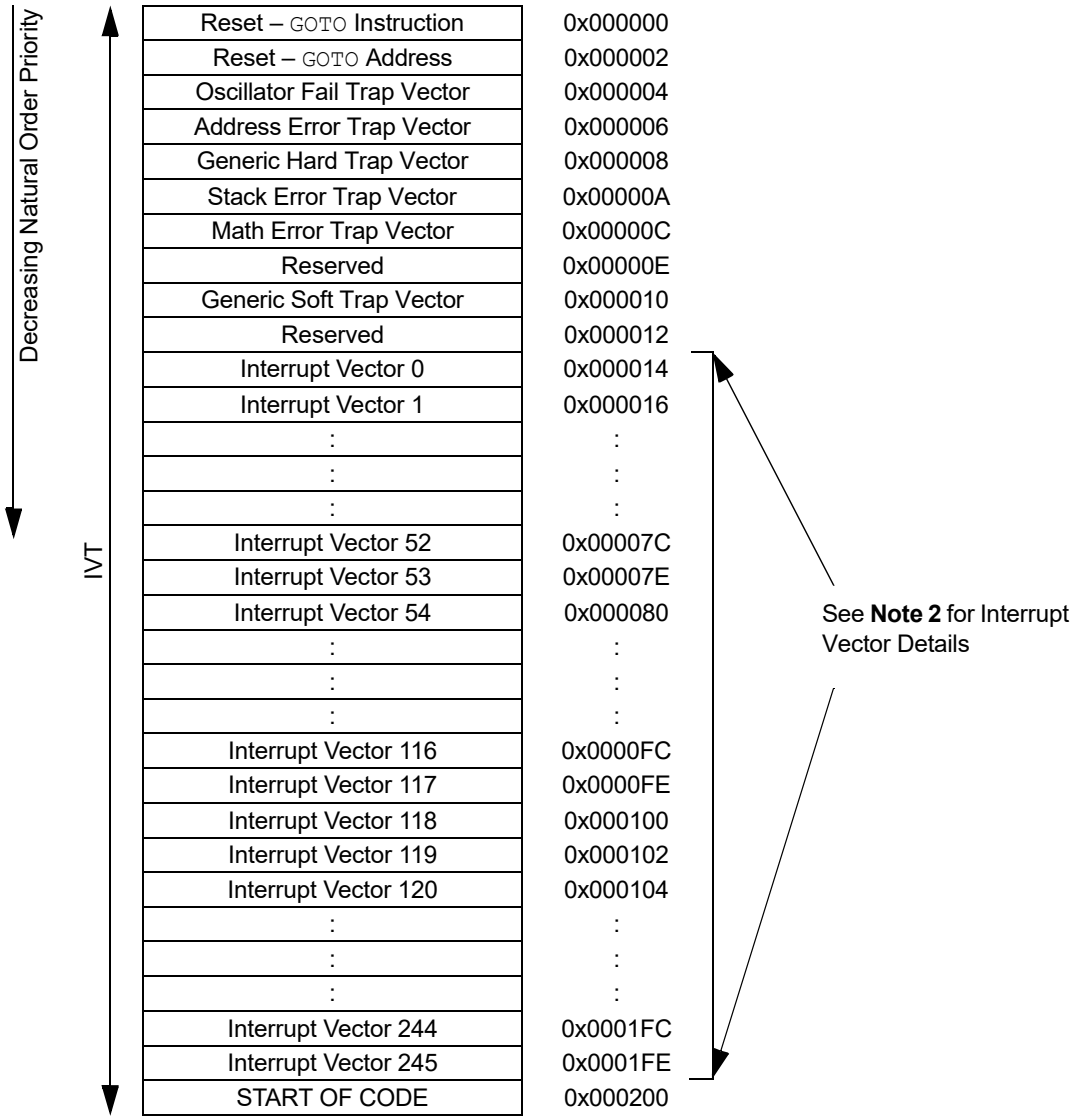

- Six Processor Exceptions and Software Traps
- Seven User-Selectable Priority Levels
- Interrupt Vector Table (IVT) with a Unique Vector for each Interrupt or Exception Source
- Fixed Priority within a Specified User Priority Level
- Fixed Interrupt Entry and Return Latencies
- Alternate Interrupt Vector Table (AIVT) for Debug Support

7.1 Interrupt Vector Table

The dsPIC33CK1024MP710 family Interrupt Vector Table (IVT), shown in Figure 7-1, resides in program memory, starting at location, 000004h. The IVT contains six non-maskable trap vectors and up to 246 sources of interrupts. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Figure 7-1. dsPIC33CK1024MP710 Family Interrupt Vector Table (IVT)[1]

Notes:

1. In Dual Partition modes, each partition has a dedicated Interrupt Vector Table.
2. See Trap Vector Details.

Interrupt vectors are prioritized in terms of their natural priority. This priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with Vector 0 takes priority over interrupts at any other vector address.

7.2 Alternate Interrupt Vector Table

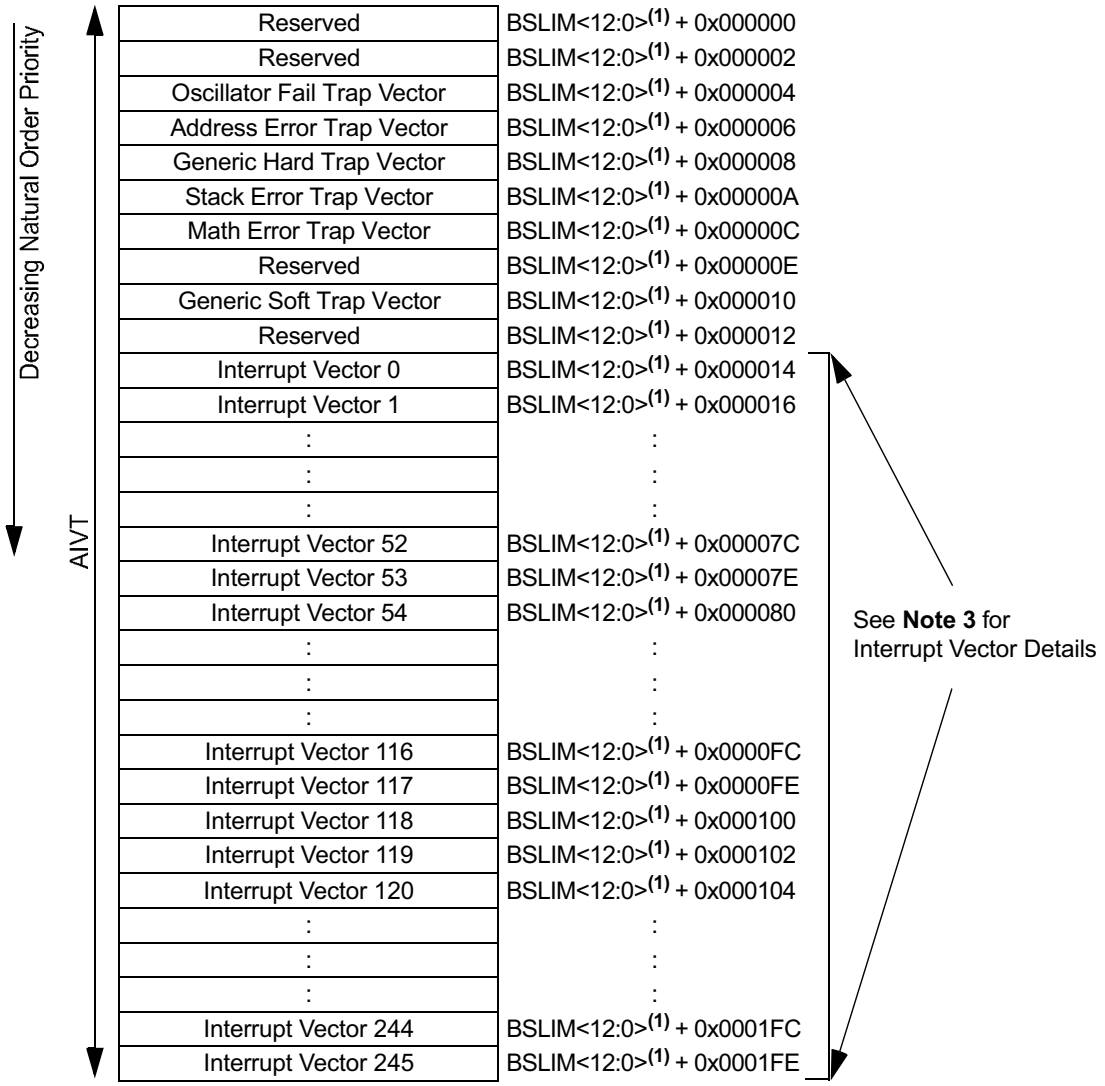

The Alternate Interrupt Vector Table (AIVT), shown in Figure 7-2, is available only when the Boot Segment (BS) is defined and the AIVT has been enabled. To enable the Alternate Interrupt Vector Table, the Configuration bit, AIVTDIS in the FSEC register, must be programmed and the AIVTEN bit must be set (INTCON2[8] = 1). When the AIVT is enabled, all interrupt and exception processes use the alternate vectors instead of the default vectors. The

© 2022-2023 Microchip Technology Inc. and its subsidiaries

AIVT begins at the start of the last page of the Boot Segment, defined by BSLIM[12:0]. The second half of the page is no longer usable space. The Boot Segment must be at least two pages to enable the AIVT.

Note: Although the Boot Segment must be enabled in order to enable the AIVT, application code does not need to be present inside of the Boot Segment. The AIVT (and IVT) will inherit the Boot Segment code protection.

Figure 7-2. dsPIC33CK1024MP710 Alternate Interrupt Vector Table(2)

Notes:

1. The address depends on the size of the Boot Segment defined by BSLIM[12:0]: [(BSLIM[12:0] – 1) x 0x800] + Offset.
2. In Dual Partition modes, each partition has a dedicated Alternate Interrupt Vector Table (if enabled).
3. See Trap Vector Details.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time.

7.3 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33CK1024MP710 family devices clear their registers in response to a Reset, which forces the PC to zero. The device then begins program execution at location, 0x000000. A GOTO instruction at the Reset address can redirect program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

1. Availability dependent on supported I/O ports. Refer to Table 8-1 for availability on device variants.
2. Availability dependent on supported peripherals, refer to Table 1 and Table 2.
3. Availability dependent on number of supported ADC channels. Refer to Table 1 and Table 2 for ADC channel availability on device variants.

7.4 Interrupt Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

7.5 Interrupt Control and Status Registers

The dsPIC33CK1024MP710 family devices implement the following registers for the interrupt controller:

- INTCON1
- INTCON2
- INTCON3
- INTCON4
- INTTREG

7.5.1 INTCON1 through INTCON4

Global interrupt control functions are controlled from INTCON1, INTCON2, INTCON3 and INTCON4.

INTCON1 contains the Interrupt Nesting Disable bit (NSTDIS), as well as the control and status flags for the processor trap sources.

The INTCON2 register controls external interrupt request signal behavior, contains the Global Interrupt Enable bit (GIE) and the Alternate Interrupt Vector Table Enable bit (AIVTEN).

INTCON3 contains the status flags for the Auxiliary PLL and DO stack overflow status trap sources.

The INTCON4 register contains the Software Generated Hard Trap Status bit (SGHT).

7.5.1.1 IFSx

The IFSx registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

7.5.1.2 IECx

The IECx registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

7.5.1.3 IPCx

The IPCx registers are used to set the Interrupt Priority Level (IPL) for each source of interrupt. Each user interrupt source can be assigned to one of seven priority levels.

7.5.1.4 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU Interrupt Priority Level, which are latched into the Vector Number (VECNUM[7:0]) and Interrupt Level bits (ILR[3:0]) fields in the INTTREG register. The new Interrupt Priority Level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence as they are listed in Table 7-2. For example, INT0 (External Interrupt 0) is shown as having Vector Number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0[0], the INT0IE bit in IEC0[0] and the INT0IP[2:0] bits in the first position of IPC0 (IPC0[2:0]).

7.6 Status/Control Registers

Although these registers are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. For more information on these registers, refer to **"Enhanced CPU"** (www.microchip.com/DS70005158).

- The CPU STATUS Register, SR, contains the IPL[2:0] bits (SR[7:5]). These bits indicate the current CPU Interrupt Priority Level. The user software can change the current CPU Interrupt Priority Level by writing to the IPLx bits.
- The CORCON register contains the IPL3 bit, which together with IPL[2:0], also indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

Bit 7 – APWM1IE Alternate PWM1 Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

Bit 6 – CCT9IE Capture/Compare/Timer9 Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

Bit 5 – CCP9IE Input Capture/Output Compare 9 Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

Bit 4 – CLC4NIE CLC4 Negative Edge Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

Bit 3 – CLC3NIE CLC3 Negative Edge Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

Bit 2 – CLC2NIE CLC2 Negative Edge Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

Bit 1 – CLC1NIE CLC1 Negative Edge Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

Bit 0 – CLC4PIE CLC4 Positive Edge Interrupt Enable bit

Value	Description
1	Interrupt enabled
0	Interrupt not enabled

8. I/O Ports

This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive source. To complement the information in this data sheet, refer to **"I/O Ports with Edge Detect"** (www.microchip.com/DS70005322).

Many of the device pins are shared among the peripherals and the Parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

Some of the key features of the I/O ports are:

- Individual Output Pin Open-Drain Enable/Disable
- Individual Input Pin Weak Pull-up and Pull-Down
- Monitor Selective Inputs and Generate Interrupt when Change in Pin State is Detected
- Operation during Sleep and Idle modes

8.1 Parallel I/O (PIO) Ports

All port pins have 12 registers directly associated with their operation as digital I/Os. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input.

All port pins are defined as inputs after a Reset. Reads from the latch (LATx), read the latch. Writes to the latch, write the latch. Reads from the port (PORTx), read the port pins, while writes to the port pins, write the latch. Any bit and its associated data and control registers that are not valid for a particular device are disabled. This means the corresponding LATx and TRISx registers, and the port pin are read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs. Table 8-1 shows the pin availability. Figure 8-1 shows the 5V input tolerant pins across this device.

Figure 8-1. Block Diagram of a Typical Shared Port Structure

8.1.1 Open-Drain Configuration

In addition to the PORTx, LATx and TRISx registers for data control, port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Enable for PORTx register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

The open-drain feature allows the generation of outputs, other than V_{DD}, by using external pull-up resistors. The maximum open-drain voltage allowed on any pin is the same as the maximum V_{IH} specification for that particular pin.

8.2 Configuring Analog and Digital Port Pins

The ANSELx registers control the operation of the analog port pins. The port pins that are to function as analog inputs or outputs must have their corresponding ANSELx and TRISx bits set. In order to use port pins for I/O functionality with digital modules, such as timers, UARTs, etc., the corresponding ANSELx bit must be cleared.

The ANSELx registers have a default value of 0xFFFF; therefore, all pins that share analog functions are analog (not digital) by default.

Pins with analog functions affected by the ANSELx registers are listed with a buffer type of analog in the Pinout I/O Descriptions (see 1. Device Overview).

If the TRISx bit is cleared (output) while the ANSELx bit is set, the digital output level (V_{OH} or V_{OL}) is converted by an analog peripheral, such as the ADC module or comparator module.

When the PORTx register is read, all pins configured as analog input channels are read as cleared (a low level).

Pins configured as digital inputs do not convert an analog input. Analog levels on any pin, defined as a digital input (including the ANx pins), can cause the input buffer to consume current that exceeds the device specifications.

8.2.1 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a `NOP`.

8.3 Input Change Notification (ICN)

The Input Change Notification function of the I/O ports allows the dsPIC33CK1024MP710 family devices to generate interrupt requests to the processor in response to a Change-of-State (COS) on selected input pins. This feature can detect input Change-of-States, even in Sleep mode, when the clocks are disabled. Every I/O port pin can be selected (enabled) for generating an interrupt request on a Change-of-State. Five control registers are associated with the Change Notification (CN) functionality of each I/O port. To enable the Change Notification feature for the port, the ON bit (CNCONx[15]) must be set.

The CNEN0x and CNEN1x registers contain the CN interrupt enable control bits for each of the input pins. The setting of these bits enables a CN interrupt for the corresponding pins. Also, these bits, in combination with the CNSTYLE bit (CNCONx[11]), define a type of transition when the interrupt is generated. Possible CN event options are listed in Table 8-2.

Table 8-2. Change Notification Event Options

CNSTYLE Bit (CNCONx[11])	CNEN1x Bit	CNEN0x Bit	Change Notification Event Description
0	Does not matter	0	Disabled
0	Does not matter	1	Detects a mismatch between the last read state and the current state of the pin
1	0	0	Disabled
1	0	1	Detects a positive transition only (from '0' to '1')
1	1	0	Detects a negative transition only (from '1' to '0')
1	1	1	Detects both positive and negative transitions

The CNSTATx register indicates whether a change occurred on the corresponding pin since the last read of the PORTx bit. In addition to the CNSTATx register, the CNFx register is implemented for each port. This register contains flags for Change Notification events. These flags are set if the valid transition edge, selected in the CNEN0x and CNEN1x registers, is detected. CNFx stores the occurrence of the event. CNFx bits must be cleared in software

© 2022-2023 Microchip Technology Inc. and its subsidiaries

to get the next Change Notification interrupt. The CN interrupt is generated only for the I/Os configured as inputs (corresponding TRISx bits must be set).

Note: Pull-ups and pull-downs on Input Change Notification pins should always be disabled when the port pin is configured as a digital output.

8.4 Peripheral Pin Select (PPS)

A major challenge in general purpose devices is providing the largest possible set of peripheral features, while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient work arounds in application code, or a complete redesign, may be the only option.

Peripheral Pin Select configuration provides an alternative to these choices by enabling peripheral set selection and placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The Peripheral Pin Select configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to any one of these I/O pins. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

8.4.1 Available Pins

The number of available pins is dependent on the particular device and its pin count. Pins that support the Peripheral Pin Select feature include the label, “RPn”, in their full pin designation, where “n” is the remappable pin number. “RP” is used to designate pins that support both remappable input and output functions.

8.4.2 Available Peripherals

The peripherals managed by the Peripheral Pin Select are all digital only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital only peripheral modules are never included in the Peripheral Pin Select feature. This is because the peripheral’s function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. One example includes I^2C modules. A similar requirement excludes all modules with analog inputs, such as the A/D Converter (ADC)

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/Os and digital communication peripherals associated with the pin. Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

8.4.3 Controlling Configuration Changes

Because peripheral mapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. The dsPIC33CK1024MP710 devices have implemented the control register lock sequence.

8.4.3.1 Control Register Lock

Under normal operation, writes to the RPINRx and RPORx registers are not allowed. Attempted writes will appear to execute normally, but the contents of the registers will remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK bit (RPCON[11]). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear IOLOCK, the NVMKEY unlock sequence must be executed:

© 2022-2023 Microchip Technology Inc. and its subsidiaries

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Clear (or set) IOLOCK as a single operation.

IOLOCK remains in one state until changed. This allows all of the Peripheral Pin Selects to be configured with a single unlock sequence, followed by an update to all of the control registers. Then, IOLOCK can be set with a second lock sequence.

Note: MPLAB® XC16 provides a built-in C language function for unlocking and modifying the RPCON register:
`__builtin_write_RPCON(value);`
For more information, see the MPLAB® XC16 Help files.

8.5 Considerations for Peripheral Pin Selection

The ability to control Peripheral Pin Selection introduces several considerations into application design that most users would never think of otherwise. This is particularly true for several common peripherals, which are only available as remappable peripherals.

The main consideration is that the Peripheral Pin Selects are not available on default pins in the device's default (Reset) state. More specifically, because all RPINRx registers reset to '1's and RPORx registers reset to '0's, this means all PPS inputs are tied to V_{SS}, while all PPS outputs are disconnected. This means that before any other application code is executed, the user must initialize the device with the proper peripheral configuration. Because the IOLOCK bit resets in the Unlocked state, it is not necessary to execute the unlock sequence after the device has come out of Reset. For application safety, however, it is always better to set IOLOCK and lock the configuration after writing to the control registers.

The NVMKEY unlock sequence must be executed as an Assembly language routine. If the bulk of the application is written in C, or another high-level language, the unlock sequence should be performed by writing in-line assembly or by using the `__builtin_write_RPCON(value)` function provided by the compiler.

Choosing the configuration requires a review of all Peripheral Pin Selects and their pin assignments, particularly those that will not be used in the application. In all cases, unused pin-selectable peripherals should be disabled completely. Unused peripherals should have their inputs assigned to an unused RPn pin function. I/O pins with unused RPn functions should be configured with the null peripheral output.

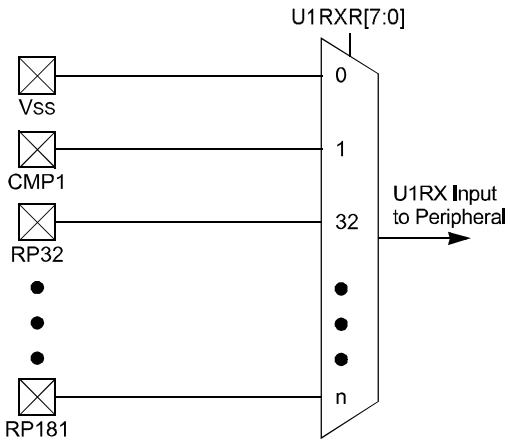

8.6 Input Mapping

The inputs of the Peripheral Pin Select options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The RPINRx registers are used to configure peripheral input mapping. Each register contains sets of 8-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 8-bit index value maps the RPn pin with the corresponding value, or internal signal, to that peripheral. See Table 8-3 for a list of available inputs.

For example, Figure 8-2 illustrates remappable pin selection for the U1RX input.

8.7 Virtual Connections

The dsPIC33CK1024MP710 devices support six virtual RPn pins (RP176-RP181), which are identical in functionality to all other RPn pins, with the exception of pinouts. These six pins are internal to the devices and are not connected to a physical device pin.

These pins provide a simple way for inter-peripheral connection without utilizing a physical pin. For example, the output of the analog comparator can be connected to RP176 and the PWM Fault input can be configured for RP176 as well. This configuration allows the analog comparator to trigger PWM Faults without the use of an actual physical pin on the device.

8.8 Output Mapping

In contrast to inputs, the outputs of the Peripheral Pin Select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Each register contains sets of 6-bit fields, with each set associated with one RPn pin (see 8.12.2. RPINR0 through 8.12.81. RPOR36). The value of the bit field corresponds to one of the peripherals and that peripheral's output is mapped to the pin (see 8.9. Mapping Limitations and Figure 8-3).

A null output is associated with the output register Reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

Figure 8-3. Multiplexing Remappable Outputs for RPn

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Note: There are six virtual output ports which are not connected to any I/O ports (RP176-RP181). These virtual ports can be accessed by RPOR20, RPOR21 and RPOR22.

8.9 Mapping Limitations

The control schema of the peripheral select pins is not limited to a small range of fixed peripheral configurations. There are no mutual or hardware-enforced lockouts between any of the peripheral mapping SFRs. Literally, any combination of peripheral mappings, across any or all of the RPn pins, is possible. This includes both many-to-one and one-to-many mappings of peripheral inputs, and outputs to pins. While such mappings may be technically possible from a configuration point of view, they may not be supportable from an electrical point of view (see Table 8-5).

Note:

1. Not all RPn pins are available on all packages. Make sure the selected device variant has the feature available on the device.

8.10 I/O Helpful Tips

1. In some cases, certain pins, as defined in 34.1. DC Characteristics under “Injection Current”, have internal protection diodes to V_{DD} and V_{SS}. The term, “Injection Current”, is also referred to as “Clamp Current”. On designated pins, with sufficient external current-limiting precautions by the user, I/O pin input voltages are allowed to be greater or lesser than the data sheet absolute maximum ratings, with respect to the V_{SS} and V_{DD} supplies. Note that when the user application forward biases either of the high or low-side internal input clamp diodes, that the resulting current being injected into the device that is clamped internally by the V_{DD} and V_{SS} power rails, may affect the ADC accuracy by four to six counts.
2. I/O pins that are shared with any analog input pin (i.e., ANx) are always analog pins, by default, after any Reset. Consequently, configuring a pin as an analog input pin automatically disables the digital input pin buffer and any attempt to read the digital input level by reading PORTx or LATx will always return a ‘0’, regardless of the digital logic level on the pin. To use a pin as a digital I/O pin on a shared ANx pin, the user application needs to configure the Analog Select for PORTx registers in the I/O ports module (i.e., ANSELx) by setting the appropriate bit that corresponds to that I/O port pin to a ‘0’.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Note: Although it is not possible to use a digital input pin when its analog function is enabled, it is possible to use the digital I/O output function, TRISx = 0x0, while the analog function is also enabled. However, this is not recommended, particularly if the analog input is connected to an external analog voltage source, which would create signal contention between the analog signal and the output pin driver.

3. Most I/O pins have multiple functions. Referring to the device pin diagrams in this data sheet, the priorities of the functions allocated to any pins are indicated by reading the pin name, from left-to-right. The left most function name takes precedence over any function to its right in the naming convention. For example: AN16/T2CK/T7CK/RC1; this indicates that AN16 is the highest priority in this example and will supersede all other functions to its right in the list. Those other functions to its right, even if enabled, would not work as long as any other function to its left was enabled. This rule applies to all of the functions listed for a given pin.
4. Each pin has an internal weak pull-up resistor and pull-down resistor that can be configured using the CNPUx and CNPDx registers, respectively. These resistors eliminate the need for external resistors in certain applications. The internal pull-up is up to ~(V_{DD} – 0.8), not V_{DD}. This value is still above the minimum V_{IH} of CMOS and TTL devices.
5. When driving LEDs directly, the I/O pin can source or sink more current than what is specified in the V_{OH}/I_{OH} and V_{OL}/I_{OL} DC characteristics specification. The respective I_{OH} and I_{OL} current rating only applies to maintaining the corresponding output at or above the V_{OH}, and at or below the V_{OL} levels. However, for LEDs, unlike digital inputs of an externally connected device, they are not governed by the same minimum V_{IH}/V_{IL} levels. An I/O pin output can safely sink or source any current less than that listed in the Absolute Maximum Ratings in 33. Electrical Characteristics of this data sheet. For example:

   V_{OH} = 2.4v @ I_{OH} = -8 mA and V_{DD} = 3.3V

   The maximum output current sourced by any 8 mA I/O pin = 12 mA.

   LED source current < 12 mA is technically permitted.
6. The Peripheral Pin Select (PPS) pin mapping rules are as follows:
   a. Only one “output” function can be active on a given pin at any time, regardless if it is a dedicated or remappable function (one pin, one output).
   b. It is possible to assign a “remappable output” function to multiple pins and externally short or tie them together for increased current drive.
   c. If any “dedicated output” function is enabled on a pin, it will take precedence over any remappable “output” function.
   d. If any “dedicated digital” (input or output) function is enabled on a pin, any number of “input” remappable functions can be mapped to the same pin.
   e. If any “dedicated analog” function(s) are enabled on a given pin, “digital input(s)” of any kind will all be disabled, although a single “digital output”, at the user’s cautionary discretion, can be enabled and active as long as there is no signal contention with an external analog input signal. For example, it is possible for the ADC to convert the digital output logic level, or to toggle a digital output on a comparator or ADC input, provided there is no external analog input, such as for a Built-In Self-Test.
   f. Any number of “input” remappable functions can be mapped to the same pin(s) at the same time, including to any pin with a single output from either a dedicated or remappable “output”.
   g. The TRISx registers control only the digital I/O output buffer. Any other dedicated or remappable active “output” will automatically override the TRISx setting. The TRISx register does not control the digital logic “input” buffer. Remappable digital “inputs” do not automatically override TRISx settings, which means that the TRISx bit must be set to input for pins with only remappable input function(s) assigned.
   h. All analog pins are enabled by default after any Reset and the corresponding digital input buffer on the pin has been disabled. Only the Analog Select for PORTx (ANSELx) registers control the digital input buffer, not the TRISx register. The user must disable the analog function on a pin using the Analog Select for PORTx registers in order to use any “digital input(s)” on a corresponding pin, no exceptions.

9. Oscillator with High-Frequency PLL

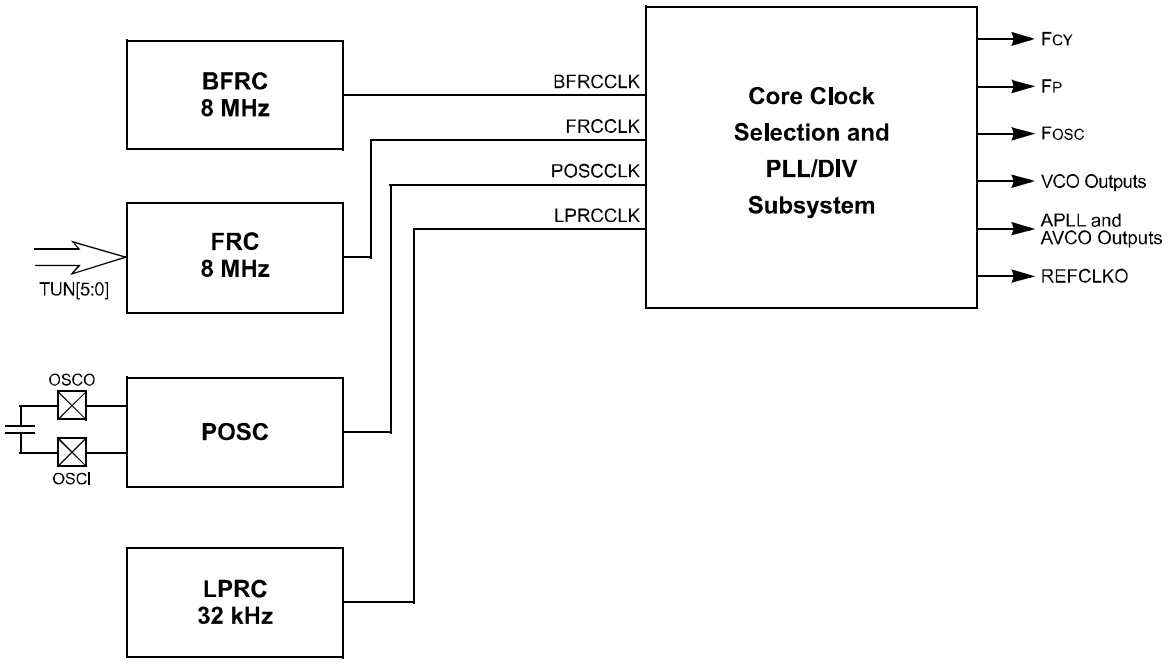

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Oscillator Module with High-Speed PLL"** (www.microchip.com/DS70005255).

The dsPIC33CK1024MP710 family oscillator with high-frequency PLL includes these characteristics:

- On-Chip Phase-Locked Loop (PLL) to Boost
  Internal Operating Frequency on Select Internal and External Oscillator Sources
- Auxiliary PLL (APLL) Clock Generator to Boost Operating Frequency for Peripherals
- Doze mode for System
  Power Savings
- Scalable Reference Clock Output (REFCLKO)
- On-the-Fly Clock Switching between Various Clock Sources
- Fail-Safe Clock Monitoring (FSCM) that Detects Clock Failure and Permits Safe Application Recovery or Shutdown

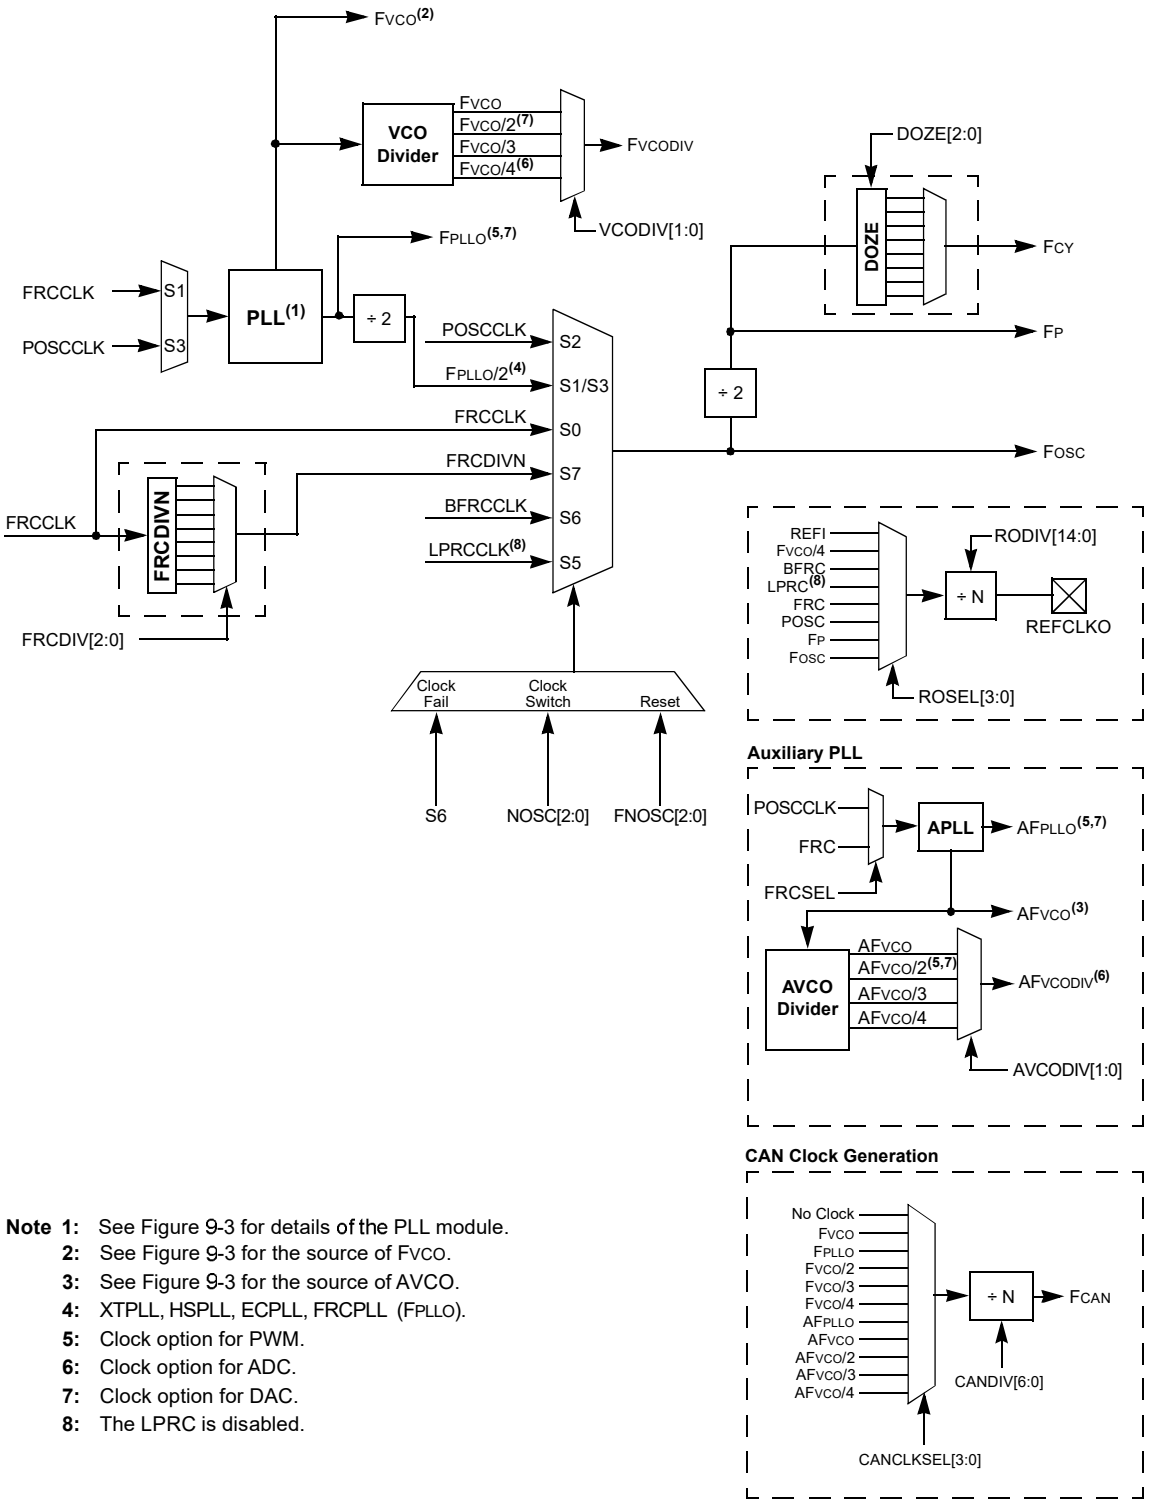

A block diagram of the dsPIC33CK1024MP710 oscillator system is shown in Figure 9-1.

9.1 Primary PLL

The Primary Oscillator and internal FRC Oscillator sources can optionally use an on-chip PLL to obtain higher operating speeds. Figure 9-3 illustrates a block diagram of the Primary PLL module.

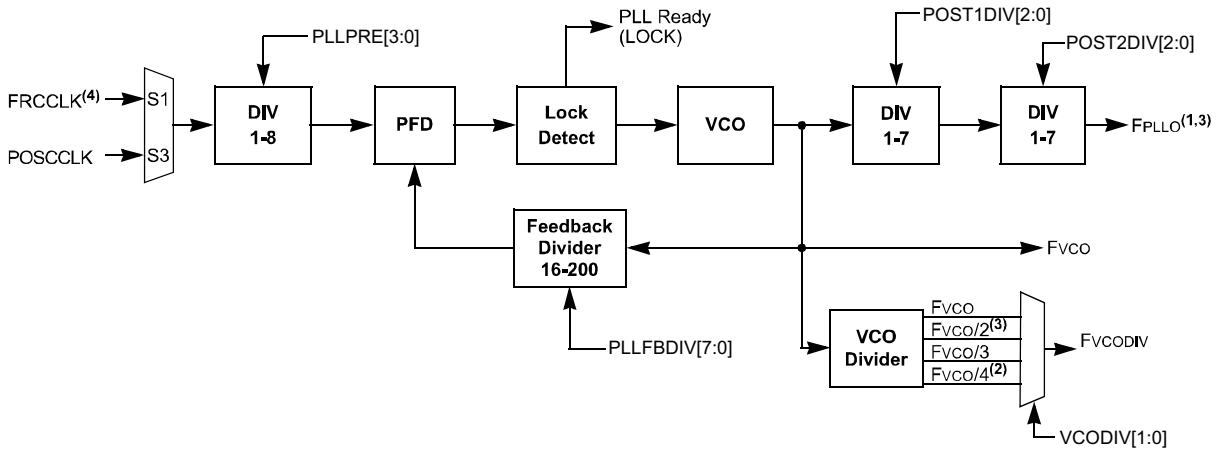

© 2022-2023 Microchip Technology Inc. and its subsidiaries

For PLL operation, the following requirements must be met at all times without exception:

- The PLL Input Frequency (F_{PLLI}) must be in the range of 8 MHz to 64 MHz
- The PFD Input Frequency (F_{PFD}) must be in the range of 8 MHz to (F_{VCO}/16) MHz

The VCO Output Frequency (F_{VCO}) must be in the range of 400 MHz to 1600 MHz

Figure 9-3. Primary Core PLL And VCO Detail

Note 1: Clock option for PWM.
2: Clock option for ADC.
3: Clock option for DAC.
4: PLL source is always FRC unless FNOSC is the Primary Oscillator with PLL.

Equation 9-1 provides the relationship between the PLL Input Frequency (F_{PLLI}) and VCO Output Frequency (F_{VCO}).

Equation 9-1. Primary Core F_{VCO} Calculation

$$FVCO = FPLLI \times \left(\frac{M}{N1}\right) = FPLLI \times \left(\frac{PLLFBDIV[7:0]}{PLLPRE[3:0]}\right)$$

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Equation 9-2 provides the relationship between the PLL Input Frequency (F_{PLLI}) and PLL Output Frequency (F_{PLLO}).

Equation 9-2. Primary Core F_{PLLO} Calculation

$$FPLLO = FPLLI \times \left(\frac{M}{N1 \times N2 \times N3}\right) = FPLLI \times \left(\frac{PLLFBDIV[7:0]}{PLLPRE[3:0] \times POST1DIV[2:0] \times POST2DIV[2:0]}\right)$$

Where:

M = $PLLFBDIV[7:0]$
$N1$ = $PLLPRE[3:0]$
$N2$ = $POST1DIV[2:0]$
$N3$ = $POST2DIV[2:0]$

Note: The PLL Phase Detector Input Divider Select (PLLPREx) bits and the PLL Feedback Divider (PLLFBDIVx) bits should not be changed when operating in PLL mode. Therefore, the user must start on either a non-PLL source or clock switch to a non-PLL source (e.g., internal FRC Oscillator) to make any necessary changes and then clock switch to the desired PLL source.

Using Two-Speed Start-up (IESO (FOSCSEL[7])) with a PLL source will start the device on the FRC while preparing the PLL. Once the PLL is ready, the device will switch automatically to the new source. This mode should not be used if changes are needed to the PLLPREx and PLLFBDIVx bits because the PLL may be running before user code execution begins.

It is not permitted to directly clock switch from one PLL clock source to a different PLL clock source. The user would need to transition between PLL clock sources with a clock switch to a non-PLL clock source.

Example 9-1. Code for Using Primary PLL with 8 MHz Internal FRC

```
//code example for 50 MIPS system clock using 8MHz FRC
// Select Internal FRC at POR
_FOSCSEL(FNOSC_FRC & IESO_OFF);
// Enable Clock Switching
_FOSC(FCKSM_CSECMD);
int main()
{
// Configure PLL prescaler, both PLL postscalers, and PLL feedback divider
CLKDIVbits.PLLPRE = 1;          // N1=1
PLLFBDbits.PLLFBDIV = 125;      // M = 125
PLLDIVbits.POST1DIV = 5;        // N2=5
PLLDIVbits.POST2DIV = 1;        // N3=1
// Initiate Clock Switch to FRC with PLL (NOSC=0b001)
__builtin_write_OSCCONH(0x01);
__builtin_write_OSCCONL(OSCCON | 0x01);
// Wait for Clock switch to occur
while (OSCCONbits.OSWEN!= 0);
}
```

Note: $F_{PLLO} = F_{PLLI} * M/(N1 * N2 * N3)$; $F_{PLLI} = 8$; M = 125; N1 = 1; N2 = 5; N3 = 1;
so $F_{PLLO} = 8 * 125/(1 * 5 * 1) = 200$ MHz or 50 MIPS.

9.2 Auxiliary PLL

The dsPIC33CK1024MP710 device family implements an Auxiliary PLL (APLL) module for each core present. The APLL is used to generate various peripheral clock sources independent of the system clock. Figure 9-4 shows a block diagram of the Auxiliary Core APLL module.

For APLL operation, the following requirements must be met at all times without exception:

- The APLL Input Frequency (AF_{PLLI}) must be in the range of 8 MHz to 64 MHz
- The APFD Input Frequency (AF_{PFD}) must be in the range of 8 MHz to (AF_{VCO}/16) MHz
- The AVCO Output Frequency (AF_{VCO}) must be in the range of 400 MHz to 1600 MHz

Figure 9-4. Auxiliary Core APLL and VCO Detail

Notes:

1. Clock option for PWM.
2. Clock option for ADC.
3. Clock option for DAC.

Equation 9-3 provides the relationship between the APLL Input Frequency (AF_{PLLI}) and the AVCO Output Frequency (AF_{VCO}).

Equation 9-3. Auxiliary Core AF_{VCO} Calculation

$$FVCO = FPLLI \times \left(\frac{M}{N1}\right) = FPLLI \times \left(\frac{PLLFBDIV\ [7:0]}{PLLPRE\ [3:0]}\right)$$

Equation 9-4 provides the relationship between the APLL Input Frequency (AF_{PLLI}) and APLL Output Frequency (AF_{PLLO}).

Equation 9-4. Auxiliary Core AF_{PLLO} Calculation

$$AFPLLO = AFPLLI \times \left(\frac{M}{N1 \times N2 \times N3}\right) = AFPLLI \times \left(\frac{APLLFBDIV\ [7:0]}{APLLPRE\ [3:0] \times APOST1DIV\ [2:0] \times APOST2DIV\ [2:0]}\right)$$

Where:

M = APLLFBDIV[7:0]

*N*1 = APLLPRE[3:0]

© 2022-2023 Microchip Technology Inc. and its subsidiaries

*N*2 = APOST1DIV[2:0]

*N*3 = APOST2DIV[2:0]

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Example 9-2. Code for Using Auxiliary PLL with the Internal FRC Oscillator

```
//code example for AFVCO = 1 GHz and AFPLLO = 500 MHz using 8 MHz internal FRC
// Configure the source clock for the APLL
ACLKCON1bits.FRCSEL = 1;       // Select internal FRC as the clock source
// Configure the APLL prescaler, APLL feedback divider, and both APLL
postscalers.
ACLKCON1bits.APLLPRE = 1;      // N1 = 1
APLLFBD1bits.APLLFBDIV = 125;  // M = 125
APLLDIV1bits.APOST1DIV = 2;    // N2 = 2
APLLDIV1bits.APOST2DIV = 1;    // N3 = 1
// Enable APLL
ACLKCON1bits.APLLEN = 1;
```

Note: Even with the APLLEN bit set, another peripheral must generate a clock request before the APLL will start.

9.3 CPU Clocking

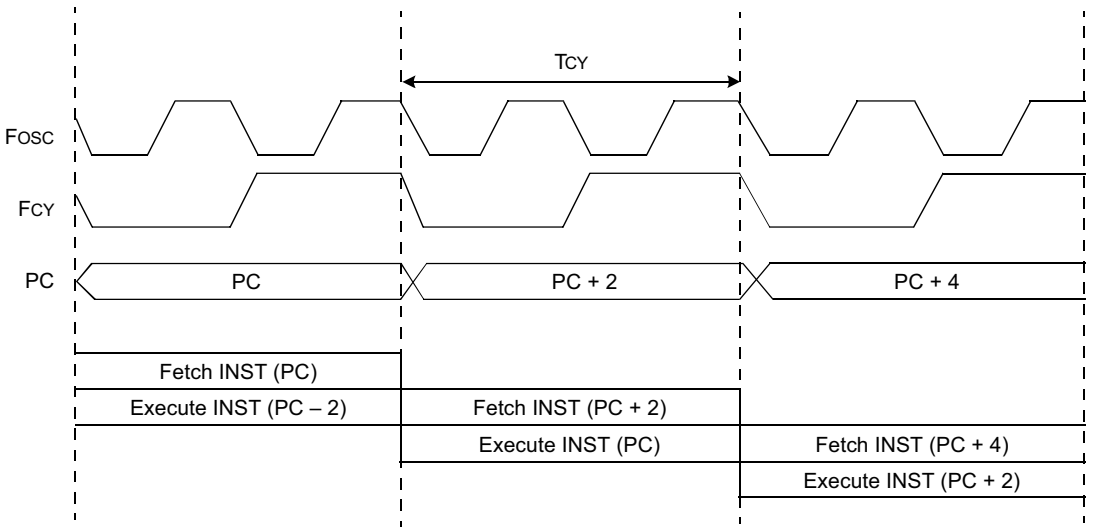

The dsPIC33CK1024MP710 devices can be configured to use any of the following clock configurations:

- Primary Oscillator (POSC) on the OSCI and OSCO pins
- Internal Fast RC (FRC) Oscillator with optional clock divider
- Internal Low-Power RC Oscillator
- Primary Oscillator with PLL (ECPLL, HSPLL, XTPLL)
- Internal Fast RC Oscillator with PLL (FRCPLL)
- Backup Internal Fast RC Oscillator (BFRC)

The system clock source is divided by two to produce the internal instruction cycle clock. In this document, the instruction cycle clock is denoted by F_{CY}. The timing diagram in Figure 9-5 illustrates the relationship between the system clock (F_{OSC}), the instruction cycle clock (F_{CY}) and the Program Counter (PC).

The internal instruction cycle clock (F_{CY}) can be output on the OSCO I/O pin if the Primary Oscillator mode (POSCMD[1:0]) is not configured as HS/XT. For more information, see 9. Oscillator with High-Frequency PLL.

9.4 Primary Oscillator (POSC)

The dsPIC33CK1024MP710 family devices contain one instance of the Primary Oscillator (POSC). The Primary Oscillator is available on the OSCI and OSCO pins of the dsPIC33CK devices. This connection enables an external crystal (or ceramic resonator) to provide the clock to the device. The Primary Oscillator provides three modes of operation:

- Medium Speed Oscillator (XT Mode):
  The XT mode is a Medium Gain, Medium Frequency mode used to work with crystal frequencies of 3.5 MHz to 10 MHz.
- High-Speed Oscillator (HS Mode):
  The HS mode is a High-Gain, High-Frequency mode used to work with crystal frequencies of 10 MHz to 32 MHz.
- External Clock Source Operation (EC Mode):
  If the on-chip oscillator is not used, the EC mode allows the internal oscillator to be bypassed. The device clocks are generated from an external source (0 MHz to up to 64 MHz) and input on the OSCI pin.

Example 9-3 illustrates code for using the PLL (50 MIPS) with the Primary Oscillator.

Example 9-3. Code for Using PLL (50 MIPS) with Primary Oscillator (POSC)

```
//code example for 50 MIPS system clock using POSC with 10 MHz
external crystal
// Select FRC on POR
#pragma    config   FNOSC = FRC    // Oscillator Source Selection
(Internal Fast RC (FRC))
#pragma    config   IESO = OFF
/// Enable Clock Switching and Configure POSC in XT mode
#pragma    config   POSCMD = XT
#pragma    config   FCKSM = CSECMD
int          main()
{
        // Configure PLL prescaler, both PLL postscalers, and PLL
feedback divider
        CLKDIVbits.PLLPRE = 1;      // N1=1
        PLLFBDbits.PLLFBDIV = 100; // M = 100
        PLLDIVbits.POST1DIV = 5;    // N2=5
        PLLDIVbits.POST2DIV = 1;    // N3=1
        // Initiate Clock Switch to Primary Oscillator with PLL
(NOSC=0b011)
        __builtin_write_OSCCONH(0x03);
        __builtin_write_OSCCONL(OSCCON | 0x01);
        // Wait for Clock switch to occur
        while (OSCCONbits.OSWEN!= 0);
        // Wait for PLL to lock
        while (OSCCONbits.LOCK!= 1);
}
```

9.4.1 Primary Oscillator Pin Functionality

The Primary Oscillator pins (OSCI and OSCO) can be used for other functions when the Primary Oscillator is not being used. The POSCMD[1:0] Configuration bits in the Oscillator Configuration register (FOSC[1:0]) determine the oscillator pin function. The OSCIOFNC bit (FOSC[2]) determines the OSCO/CLKO pin function. By default, the CLKO function is active and the pin will output a clock frequency of F_{CY}. A clock signal is present on the OSCO/CLKO pin when device is unprogrammed or during the programming sequence. Care should be taken when the OSCO/CLKO pin is used to drive other circuity.

9.5 Internal Fast RC (FRC) Oscillator

The dsPIC33CK1024MP710 family devices contain one instance of the internal Fast RC (FRC) Oscillator. The FRC Oscillator provides a nominal 8 MHz clock without requiring an external crystal or ceramic resonator, which results in system cost savings for applications that do not require a precise clock reference.

The application software can tune the frequency of the oscillator using the FRC Oscillator Tuning bits (TUN[5:0]) in the FRC Oscillator Tuning register (OSCTUN[5:0]).

9.6 Low-Power RC Oscillator

The dsPIC33CK1024MP710 family devices contain one instance of the Low-Power RC (LPRC) Oscillator, which provides a nominal clock frequency of 32.768 kHz. The dsPIC33CK1024MP710 family devices implement the LPRC function with the BFRC and post-divider to yield a 50% duty cycle output.

The LPRC is the clock source for the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM) circuits in the clock subsystem. The LPRC Oscillator is shut off in Sleep mode.

The LPRC Oscillator remains enabled under these conditions:

- The FSCM is enabled
- The WDT is enabled
- The LPRC Oscillator is selected as the system clock

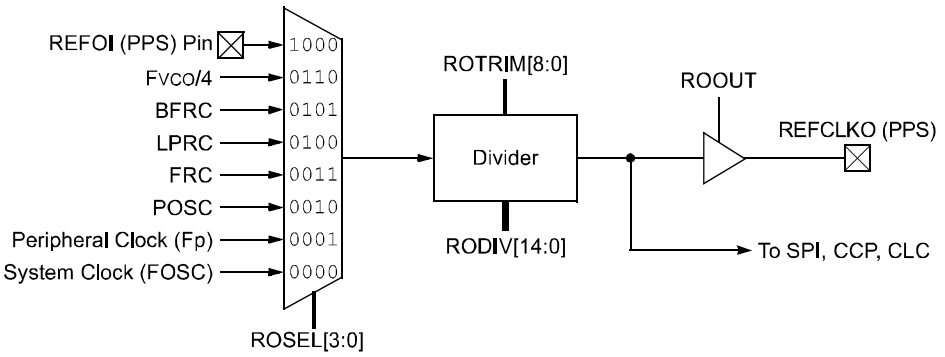

9.7 Backup Internal Fast RC (BFRC) Oscillator

The oscillator block provides a stable reference clock source for the Fail-Safe Clock Monitor (FSCM). When FSCM is enabled in the FCKSM[1:0] Configuration bits (FOSC[7:6]), it constantly monitors the main clock source against a reference signal from the 8 MHz Backup Internal Fast RC (BFRC) Oscillator. In case of a clock failure, the Fail-Safe Clock Monitor switches the clock to the BFRC Oscillator, allowing for continued low-speed operation or a safe application shutdown.

9.8 Reference Clock Output

In addition to the CLKO output ($F_{OSC}/2$), the dsPIC33CK1024MP710 family devices can be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock submultiples to drive external devices in the application. CLKO is enabled by Configuration bit, OSCIOFNC, and is independent of the REFCLKO reference clock. REFCLKO is mappable to any I/O pin that has mapped output capability. The reference clock output module block diagram is shown in Figure 9-6.

Figure 9-6. Reference Clock Generator

This reference clock output is controlled by the REFOCONL and REFOCONH registers. Setting the ROEN bit (REFOCONL[15]) makes the clock signal available on the REFCLKO pin. The RODIV[14:0] bits (REFOCONH[14:0]) and ROTRIM[8:0] bits (REFOTRIM[15:7]) enable the selection of different clock divider options. The formula for determining the final frequency output is shown in Equation 9-5. The ROSWEN bit (REFOCONL[9]) indicates that

© 2022-2023 Microchip Technology Inc. and its subsidiaries

the clock divider has been successfully switched. In order to switch the REFCLKO divider, the user should ensure that this bit reads as '0'. Write the updated values to the RODIV[14:0] or ROTRIM[8:0] bits, set the ROSWEN bit and then wait until it is cleared before assuming that the REFCLKO clock is valid.

Equation 9-5. Calculating Frequency Output

$$FREFOUT = \frac{FREFIN}{2 \bullet (RODIV[14:0] + ROTRIM[8:0]/512)}$$

Where: $FREFOUT$ = Output Frequency
$FREFIN$ = Input Frequency
When $RODIV[14:0]$ = 0, the output clock is the same as the input clock.

The ROSEL[3:0] bits (REFOCONL[3:0]) determine which clock source is used for the reference clock output. The ROSLP bit (REFOCONL[11]) determines if the reference source is available on REFCLKO when the device is in Sleep mode.

To use the reference clock output in Sleep mode, both the ROSLP bit must be set and the clock selected by the ROSEL[3:0] bits must be enabled for operation during Sleep mode, if possible. Clearing the ROSEL[3:0] bits allows the reference output frequency to change, as the system clock changes during any clock switches. The ROOUT bit enables/disables the reference clock output on the REFCLKO pin.

The ROACTIV bit (REFOCONL[8]) indicates that the module is active; it can be cleared by disabling the module (setting ROEN to '0'). The user must not change the reference clock source, or adjust the divider when the ROACTIV bit indicates that the module is active. To avoid glitches, the user should not disable the module until the ROACTIV bit is '1'.

9.9 Oscillator Configuration

The oscillator system has both Configuration registers and SFRs to configure, control and monitor the system. The FOSCSEL and FOSC Configuration registers (FOSCSEL and FOSC, respectively) are used for initial setup.

Table 9-1 lists the configuration settings that select the device's oscillator source and operating mode at a Power-on Reset (POR).

9.10 OSCCON Unlock Sequence

The OSCCON register is protected against unintended writes through a lock mechanism. The upper and lower bytes of OSCCON have their own unlock sequence, and both must be used when writing to both bytes of the register.

Before OSCCON can be written to, the following unlock sequence must be used:

1. Execute the unlock sequence for the OSCCON high byte. In two back-to-back instructions:
   - Write 0x78 to OSCCON[15:8]
   - Write 0x9A to OSCCON[15:8]
2. In the instruction immediately following the unlock sequence, the OSCCON[15:8] bits can be modified.
3. Execute the unlock sequence for the OSCCON low byte. In two back-to-back instructions:
   - Write 0x46 to OSCCON[7:0]
   - Write 0x57 to OSCCON[7:0]
4. In the instruction immediately following the unlock sequence, the OSCCON[7:0] bits can be modified.

Note: MPLAB® XC16 provides a built-in C language function, including the unlocking sequence to modify high and low bytes in the OSCCON register:

```
__builtin_write_OSCCONH(value)
__builtin_write_OSCCONL(value)
```

9.11.1 Oscillator Control Register

Name: OSCCON(1)
Offset: 0xF84

Notes:

1. Writes to this register require an unlock sequence.
2. Direct clock switches between any Primary Oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transitional clock source between the two PLL modes.
3. This bit should only be cleared in software.

Name: CANCLKCON
Offset: 0xF9A

Notes:

1. The user must ensure the input clock source is 640 MHz or less. Operation with input reference frequency above 640 MHz will result in unpredictable behavior.
2. The CANCLKDIVx divider value must not be changed during CAN module operation.
3. The user must ensure the maximum clock output frequency of the divider is 80 MHz or less.

10. Direct Memory Access (DMA) Controller

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Direct Memory Access Controller (DMA)"** (www.microchip.com/DS30009742).

The Direct Memory Access (DMA) Controller is designed to service high data throughput peripherals operating on the SFR bus, allowing them to access data memory directly and alleviating the need for CPU-intensive management. By allowing these data-intensive peripherals to share their own data path, the main data bus is also deloaded, resulting in additional power savings.

The DMA Controller functions both as a peripheral and a direct extension of the CPU. It is located on the microcontroller data bus, between the CPU and DMA-enabled peripherals, with direct access to SRAM. This partitions the SFR bus into two buses, allowing the DMA Controller access to the DMA-capable peripherals located on the new DMA SFR bus. The controller serves as an Initiator device on the DMA SFR bus, controlling data flow from DMA-capable peripherals.

The controller also monitors CPU instruction processing directly, allowing it to be aware of when the CPU requires access to peripherals on the DMA bus and automatically relinquishing control to the CPU as needed. This increases the effective bandwidth for handling data without DMA operations, causing a processor Stall. This makes the controller essentially transparent to the user.

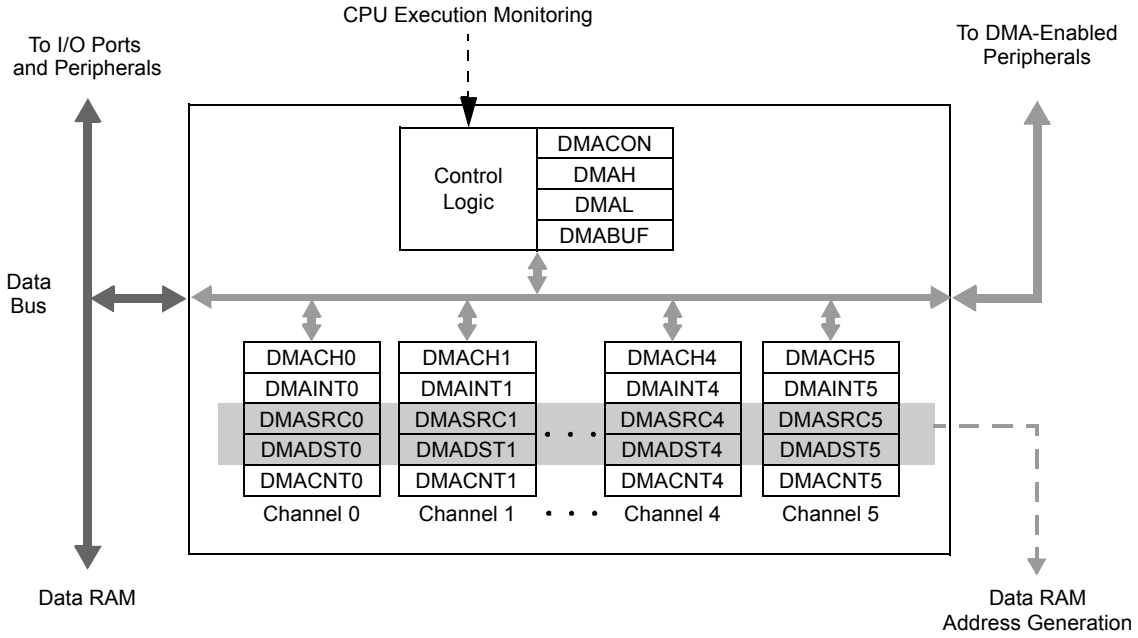

The DMA Controller has these features:

- A Total of Eight
  Independently Programmable Channels
- Concurrent Operation with the CPU (no DMA caused Wait states)
- DMA Bus Arbitration
- Five Programmable Address modes
- Four Programmable Transfer modes
- Four Flexible Internal Data Transfer modes
- Byte or Word Support for Data Transfer
- 16-Bit Source and Destination Address Register for each Channel, Dynamically Updated and Reloadable
- 16-Bit Transaction Count Register, Dynamically Updated and Reloadable
- Upper and Lower Address Limit Registers
- Counter Half-Full Level Interrupt
- Software Triggered Transfer
- Null Write mode for Symmetric Buffer Operations

A simplified block diagram of the DMA Controller is shown in Figure 10-1.

Figure 10-1. DMA Functional Block Diagram

10.1 Summary of DMA Operations

The DMA Controller is capable of moving data between addresses according to a number of different parameters. Each of these parameters can be independently configured for any transaction. In addition, any or all of the DMA channels can independently perform a different transaction at the same time. Transactions are classified by these parameters:

- Source and destination (SFRs and data RAM)
- Data size (byte or word)
- Trigger source
- Transfer mode (One-Shot, Repeated or Continuous)
- Addressing modes (Fixed Address or Address Blocks with or without Address Increment/Decrement)

In addition, the DMA Controller provides channel priority arbitration for all channels.

10.1.1 Source and Destination

Using the DMA Controller, data may be moved between any two addresses in the Data Space. The SFR space (0000h to 0FFFh), or the data RAM space (1000h to 4FFFh), can serve as either the source or the destination. Data can be moved between these areas in either direction or between addresses in either area. The four different combinations are shown in 10.1.5. Addressing Modes.

If it is necessary to protect areas of data RAM, the DMA Controller allows the user to set upper and lower address boundaries for operations in the Data Space above the SFR space. The boundaries are set by the DMAH and DMAL Limit registers. If a DMA channel attempts an operation outside of the address boundaries, the transaction is terminated and an interrupt is generated.

10.1.2 Data Size

The DMA Controller can handle both 8-bit and 16-bit transactions. Size is user-selectable using the SIZE bit (DMACHn[1]). By default, each channel is configured for word-size transactions. When byte-size transactions are chosen, the LSB of the source and/or destination address determines if the data represent the upper or lower byte of the data RAM location.

10.1.3 Trigger Source

The DMA Controller can use 82 of the device's interrupt sources to initiate a transaction. The DMA trigger sources occur in reverse order from their natural interrupt priority and are shown in 10.1.5. Addressing Modes.

Since the source and destination addresses for any transaction can be programmed independently of the trigger source, the DMA Controller can use any trigger to perform an operation on any peripheral. This also allows DMA channels to be cascaded to perform more complex transfer operations.

10.1.4 Transfer Mode

The DMA Controller supports four types of data transfers, based on the volume of data to be moved for each trigger.

- One-Shot: A single transaction occurs for each trigger.
- Continuous: A series of back-to-back transactions occur for each trigger; the number of transactions is determined by the DMACNTn transaction counter.
- Repeated One-Shot: A single transaction is performed repeatedly, once per trigger, until the DMA channel is disabled.
- Repeated Continuous: A series of transactions are performed repeatedly, one cycle per trigger, until the DMA channel is disabled.

All transfer modes allow the option to have the source and destination addresses, and counter value, automatically reloaded after the completion of a transaction.

10.1.5 Addressing Modes

The DMA Controller also supports transfers between single addresses or address ranges. The four basic options are:

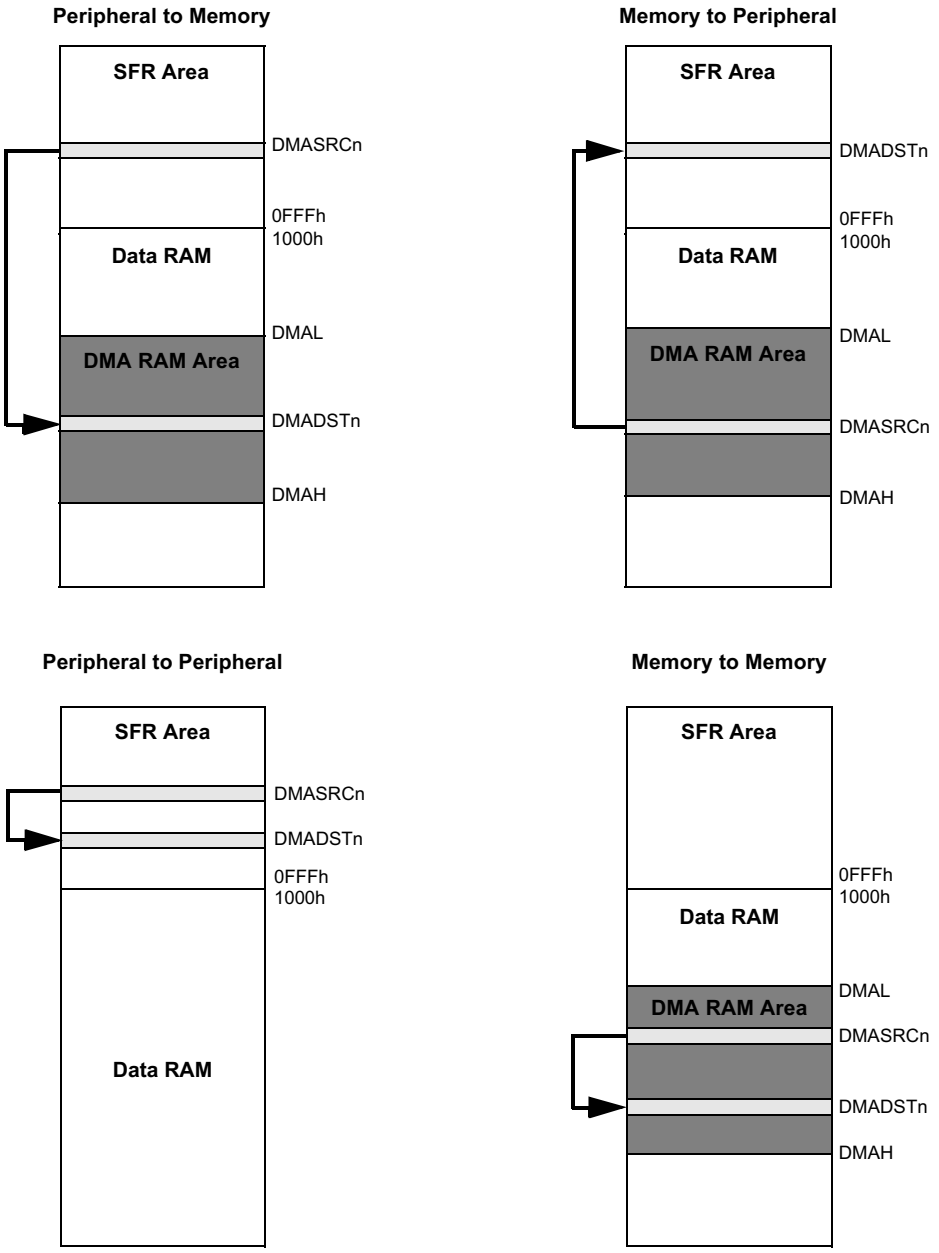

- Fixed-to-Fixed: Between two constant addresses
- Fixed-to-Block: From a constant source address to a range of destination addresses
- Block-to-Fixed: From a range of source addresses to a single, constant destination address
- Block-to-Block: From a range of source addresses to a range of destination addresses

The option to select auto-increment or auto-decrement of source and/or destination addresses is available for Block Addressing modes.

In addition to the four basic modes, the DMA Controller also supports Peripheral Indirect Addressing (PIA) mode, where the source or destination address is generated jointly by the DMA Controller and a PIA-capable peripheral. When enabled, the DMA channel provides a base source and/or destination address, while the peripheral provides a fixed range offset address.

10.1.6 Channel Priority

Each DMA channel functions independently of the others, but also competes with the others for access to the data and DMA buses. When access collisions occur, the DMA Controller arbitrates between the channels using a user-selectable priority scheme. Two schemes are available:

- Round Robin: When two or more channels collide, the lower numbered channel receives priority on the first collision. On subsequent collisions, the higher numbered channels each receive priority based on their channel number.
- Fixed: When two or more channels collide, the lowest numbered channel always receives priority, regardless of past history; however, any channel being actively processed is not available for an immediate retrigger. If a higher priority channel is continually requesting service, it will be scheduled for service after the next lower priority channel with a pending request.

10.2 Typical Setup

To set up a DMA channel for a basic data transfer:

1. Enable the DMA Controller (DMAEN = 1) and select an appropriate channel priority scheme by setting or clearing PRSSEL.
2. Program DMAH and DMAL with appropriate upper and lower address boundaries for data RAM operations.
3. Select the DMA channel to be used and disable its operation (CHEN = 0).
4. Program the appropriate source and destination addresses for the transaction into the channel's DMASRCn and DMADSTn registers. For PIA mode addressing, use the base address value.
5. Program the DMACNTn register for the number of triggers per transfer (One-Shot or Continuous modes) or the number of words (bytes) to be transferred (Repeated modes).
6. Set or clear the SIZE bit to select the data size.
7. Program the TRMODE[1:0] bits to select the Data Transfer mode.
8. Program the SAMODE[1:0] and DAMODE[1:0] bits to select the addressing mode.
9. Enable the DMA channel by setting CHEN.
10. Enable the trigger source interrupt.

10.2.1 Peripheral Module Disable

The channels of the DMA Controller can be individually powered down using the Peripheral Module Disable (PMD) registers.

10.2.2 DMA Registers

The DMA Controller uses a number of registers to control its operation. The number of registers depends on the number of channels implemented for a particular device.

There are always four module-level registers (one control and three buffer/address):

- DMACON: DMA Engine Control Register (10.2.3.1. DMACON)
- DMAH and DMAL: DMA High and Low Address Limit Registers
- DMABUF: DMA Transfer Data Buffer

Each of the DMA channels implements five registers (two control and three buffer/address):

- DMACHn: DMA Channel n Control Register (10.2.3.5. DMACHn)
- DMAINTn: DMA Channel n Interrupt Register (10.2.3.6. DMAINTn)
- DMASRCn: DMA Data Source Address Pointer for Channel n Register
- DMADSTn: DMA Data Destination Source for Channel n Register
- DMACNTn: DMA Transaction Counter for Channel n Register

© 2022-2023 Microchip Technology Inc. and its subsidiaries

For devices, there are a total of 34 registers.

10.2.3.5 DMA Channel n Control Register

Name: DMACHn
Offset: 0xA9C, 0xAA6, 0xAB0, 0xABA, 0xAC4, 0xACE, 0xAD8, 0xAE2

Notes:

1. Only the original DMACNTn is required to be stored to recover the original DMASRCn and DMADSTn values.
2. DMACNTn will always be reloaded in Repeated mode transfers, regardless of the state of the RELOAD bit.
3. The number of transfers executed while CHREQ is set depends on the configuration of TRMODE[1:0].

Bit 10 – NULLW Null Write Mode bit

Value	Description
1	A dummy write is initiated to DMASRCn for every write to DMADSTn
0	No dummy write is initiated

Bit 9 – RELOAD Address and Count Reload bit(1)

Value	Description
1	DMASRCn, DMADSTn and DMACNTn registers are reloaded to their previous values upon the start of the next operation
0	DMASRCn, DMADSTn and DMACNTn are not reloaded on the start of the next operation(2)

Bit 8 – CHREQ DMA Channel Software Request bit(3)

Value	Description
1	A DMA request is initiated by software; automatically cleared upon completion of a DMA transfer
0	No DMA request is pending

Bits 7:6 – SAMODE[1:0] Source Address Mode Selection bits

Value	Description
11	DMASRCn is used in Peripheral Indirect Addressing and remains unchanged
10	DMASRCn is decremented based on the SIZE bit after a transfer completion
01	DMASRCn is incremented based on the SIZE bit after a transfer completion
00	DMASRCn remains unchanged after a transfer completion

Bits 5:4 – DAMODE[1:0] Destination Address Mode Selection bits

Value	Description
11	DMADSTn is used in Peripheral Indirect Addressing and remains unchanged
10	DMADSTn is decremented based on the SIZE bit after a transfer completion
01	DMADSTn is incremented based on the SIZE bit after a transfer completion
00	DMADSTn remains unchanged after a transfer completion

Name: DMAINTn
Offset: 0xA9E, 0xAA8, 0xAB2, 0xABC, 0xAC6, 0xAD0, 0xADA, 0xAE4

Notes:

1. Setting these flags in software does not generate an interrupt.
2. Testing for address limit violations (DMASRCn or DMADSTn is either greater than DMAH or less than DMAL) is NOT done before the actual access.

Bit 15 – DBUFWF DMA Buffered Data Write Flag bit(1)

Value	Description
1	The content of the DMA buffer has not been written to the location specified in DMADSTn or DMASRCn in Null Write mode
0	The content of the DMA buffer has been written to the location specified in DMADSTn or DMASRCn in Null Write mode

Bits 14:8 – CHSEL[6:0] DMA Channel Trigger Selection bits

Bit 7 – HIGHIF DMA High Address Limit Interrupt Flag bit(1,2)

Value	Description
1	The DMA channel has attempted to access an address higher than DMAH or the upper limit of the data RAM space
0	The DMA channel has not invoked the high address limit interrupt

Bit 6 – LOWIF DMA Low Address Limit Interrupt Flag bit(1,2)

Value	Description
1	The DMA channel has attempted to access the DMA SFR address lower than DMAL, but above the SFR range (07FFh)
0	The DMA channel has not invoked the low address limit interrupt

Bit 5 – DONEIF DMA Complete Operation Interrupt Flag bit(1)

Value	Description
	If CHEN = 1:
1	The previous DMA session has ended with completion
0	The current DMA session has not yet completed
	If CHEN = 0:
1	The previous DMA session has ended with completion
0	The previous DMA session has ended without completion

Bit 4 – HALFIF DMA 50% Watermark Level Interrupt Flag bit(1)

Value	Description
1	DMACNTn has reached the halfway point to 0000h
0	DMACNTn has not reached the halfway point

Bit 3 – OVRUNIF DMA Channel Overrun Flag bit(1)

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
1	The DMA channel is triggered while it is still completing the operation based on the previous trigger
0	The Overrun condition has not occurred

Bit 0 – HALFEN Halfway Completion Watermark bit

Value	Description
1	Interrupts are invoked when DMACNTn has reached its halfway point and at completion
0	An interrupt is invoked only at the completion of the transfer

11. Controller Area Network Flexible Data-Rate (CAN FD) Modules

Notes:

1. This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"CAN Flexible Data-Rate (FD) Protocol Module"** (www.microchip.com/DS70005340).
2. Not all device variants include the CAN FD peripheral. Refer to dsPIC33CK1024MP710 Product Families for availability.

11.1 Features

The CAN FD modules have the following features:

General

- Nominal (Arbitration) Bit Rate up to 1 Mbps
- Data Bit Rate up to 8 Mbps
- CAN FD Controller modes:
  - Mixed CAN 2.0B and CAN FD mode
  - CAN 2.0B mode
- Conforms to ISO11898-1:2015

Message FIFOs

- Seven FIFOs, Configurable as Transmit or Receive FIFOs
- One Transmit Queue (TXQ)
- Transmit Event FIFO (TEF) with 32-Bit Timestamp

Message Transmission

- Message Transmission Prioritization:
  - Based on priority bit field and/or
  - Message with lowest ID gets transmitted first using the TXQ
- Programmable Automatic Retransmission Attempts:
  - Unlimited, Three Attempts or Disabled

Message Reception

- 16 Flexible Filter and Mask Objects.
- Each Object can be Configured to Filter either:
  - Standard ID + first 18 data bits or
  - Extended ID
- 32-Bit Timestamp.
- The CAN FD Bit Stream Processor (BSP):
  Implements the Medium Access Control of the CAN FD Protocol Described in ISO11898-1:2015. It serializes and deserializes the bit stream, encodes and decodes the CAN FD frames,
  manages the medium access, Acknowledges frames, and detects and signals errors.
- The TX Handler: Prioritizes the Messages that are Requested for Transmission by the Transmit FIFOs. It uses the RAM interface to fetch the transmit data from RAM and provides them to the BSP for transmission.
- The BSP: Provides Received Messages to the RX Handler. The RX handler uses acceptance filters to filter out messages that shall be stored in the Receive FIFOs. It uses the RAM interface to store received data into RAM.

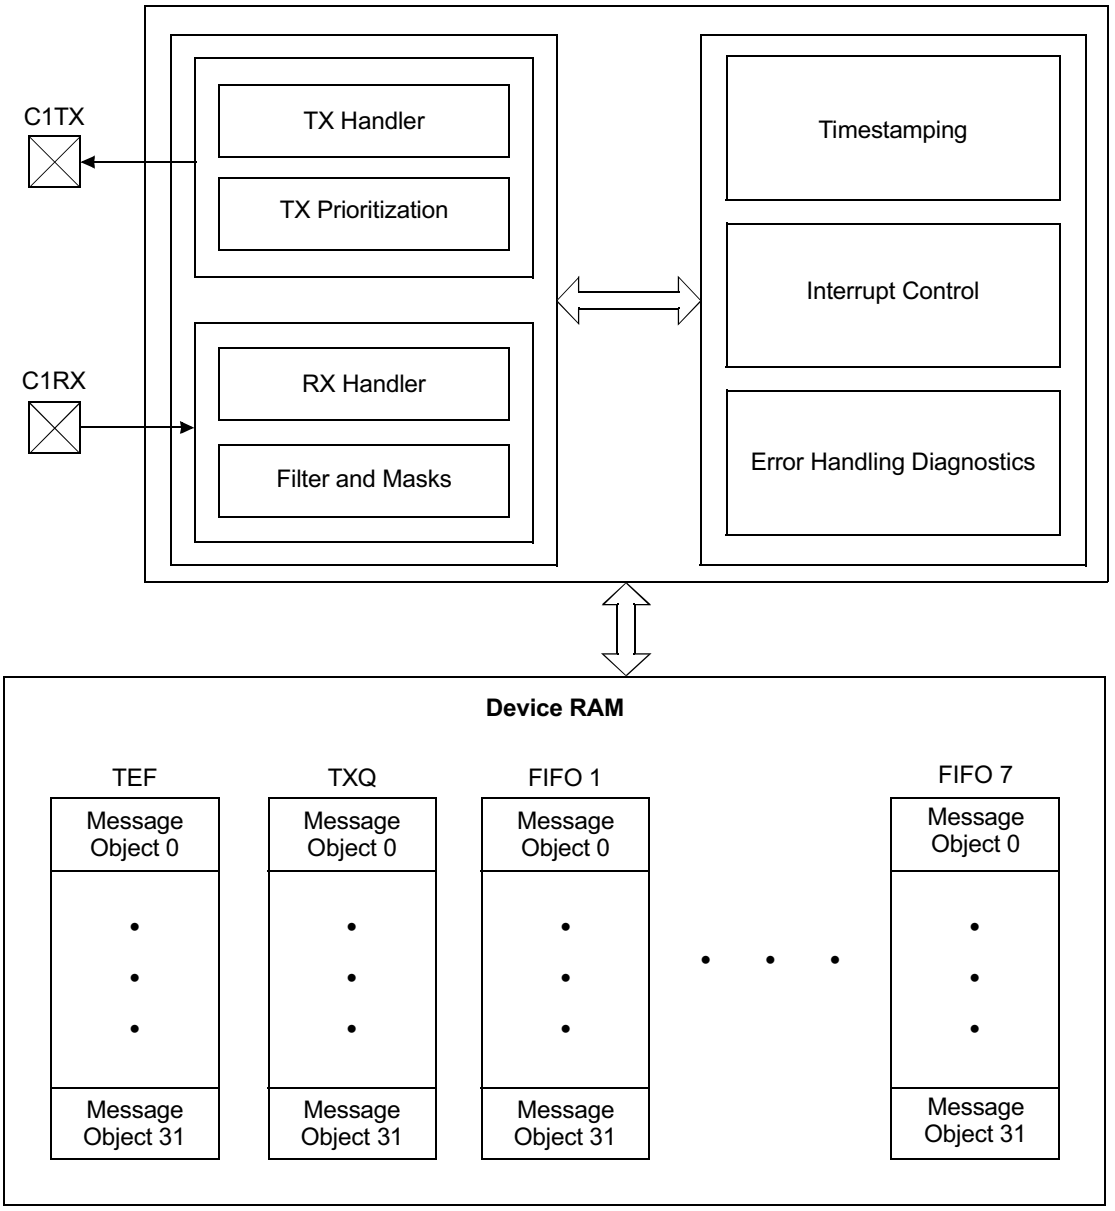

© 2022-2023 Microchip Technology Inc. and its subsidiaries

- Each FIFO can be Configured either as a
  Transmit or Receive FIFO: The FIFO control keeps track of the FIFO head and tail, and calculates the user address. In a TX FIFO, the user address points to the address in RAM where the data for the next transmit message shall be stored. In an RX FIFO, the user address points to the address in RAM where the data of the next receive message shall be read. The user notifies the FIFO that a message was written to or read from RAM by incrementing the head/tail of the FIFO.
- The Transmit Queue (TXQ): A Special Transmit FIFO that Transmits the Messages based on the ID of the Messages Stored in the Queue.
- The Transmit Event FIFO (TEF): Stores the
  Message IDs of the Transmitted Messages.
- A Free-Running Time Base Counter: Used to Timestamp Received Messages. Messages in the TEF can also be timestamped.
- The CAN FD Controller Modules: Generate Interrupts when New Messages are Received or when Messages were Transmitted Successfully.

11.2.1 CAN Control Register Low

Name: C1CONL
Offset: 0x6C0

Note:

1. These bits can only be modified in Configuration mode (OPMOD[2:0] = 100).

Bit	15	14	13	12	11	10	9	8
	CON		SIDL	BRSDIS	BUSY	WFT[1:0]		WAKFIL
Access	R/W		R/W	R/W	R/W	R/W	R/W	R/W
Reset	0		0	0	0	1	1	1

Bit	7	6	5	4	3	2	1	0
	CLKSEL	PXEDIS	ISOCRCEN	DNCNT[4:0]				
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	1	1	0	0	0	0	0

Bit 15 – CON CAN Enable bit

Value	Description
1	CAN module is enabled
0	CAN module is disabled

Bit 13 – SIDL CAN Stop in Idle Control bit

Value	Description
1	Stops module operation in Idle mode
0	Does not stop module operation in Idle mode

Bit 12 – BRSDIS Bit Rate Switching (BRS) Disable bit

Value	Description
1	Bit Rate Switching is disabled, regardless of BRS in the transmit message object
0	Bit Rate Switching depends on BRS in the transmit message object

Bit 11 – BUSY CAN Module is Busy bit

Value	Description
1	The CAN module is active
0	The CAN module is inactive

Bits 10:9 – WFT[1:0] Selectable Wake-up Filter Time bits

Value	Description
11	$T11_{FILTER}$
10	$T10_{FILTER}$
01	$T01_{FILTER}$
00	$T00_{FILTER}$

Bit 8 – WAKFIL Enable CAN Bus Line Wake-up Filter bit(1)

Value	Description
1	Uses CAN bus line filter for wake-up
0	CAN bus line filter is not used for wake-up

Bit 7 – CLKSEL Module Clock Source Select bit(1)

Value	Description
1	Auxiliary clock is active when module is enabled
0	CAN clock is active when module is enabled

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Bit 6 – PXEDIS Protocol Exception Event Detection Disabled bit(1)

A recessive "reserved bit" following a recessive FDF bit is called a Protocol Exception.

Value	Description
1	Protocol Exception is treated as a form error
0	If a Protocol Exception is detected, CAN will enter the Bus Integrating state

Bit 5 – ISOCRCEN Enable ISO CRC in CAN FD Frames bit(1)

Value	Description
1	Includes stuff bit count in CRC field and uses non-zero CRC initialization vector
0	Does not include stuff bit count in CRC field and uses CRC initialization vector with all zeros

Bits 4:0 – DNCNT[4:0] DeviceNet™ Filter Bit Number bits

Value	Description
10011-11111	Invalid selection (compares up to 18 bits of data with EID)
10010	Compares up to Data Byte 2, bit 6 with EID17
. . .	
00001	Compares up to Data Byte 0, bit 7 with EID0
00000	Does not compare data bytes

11.2.2 CAN Control Register High

Name: C1CONH
Offset: 0x6C2

Note:

1. These bits can only be modified in Configuration mode (OPMOD[2:0] = 100).

Legend: S = Settable bit; HC = Hardware Clearable bit

Bit	15	14	13	12	11	10	9	8
	TXBWS[3:0]				ABAT	REQOP[2:0]		
Access	R/W	R/W	R/W	R/W	S/HC	R/W	R/W	R/W

Access	R	R	R	R/W	R/W	R/W	R/W	R/W
Reset	1	0	0	1	1	0	0	0

Bits 15:12 – TXBWS[3:0] Transmit Bandwidth Sharing bits

Value	Description
1111-1100	4096
1011	2048
1010	1024
1001	512
1000	256
0111	128
0110	64
0101	32
0100	16
0011	8
0010	4
0001	2
0000	No delay

Bit 11 – ABAT Abort All Pending Transmissions bit

Value	Description
1	Signals all transmit buffers to abort transmission
0	Module will clear this bit when all transmissions are aborted

Bits 10:8 – REQOP[2:0] Request Operation Mode bits

Value	Description
111	Sets Restricted Operation mode
110	Sets Normal CAN 2.0 mode; error frames on CAN FD frames
101	Sets External Loopback mode
100	Sets Configuration mode
011	Sets Listen Only mode
010	Sets Internal Loopback mode
001	Sets Disable mode
000	Sets Normal CAN FD mode; supports mixing of full CAN FD and classic CAN 2.0 frames

Bits 7:5 – OPMOD[2:0] Operation Mode Status bits

Value	Description
111	Module is in Restricted Operation mode

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
110	Module is in Normal CAN 2.0 mode; error frames on CAN FD frames
101	Module is in External Loopback mode
100	Module is in Configuration mode
011	Module is in Listen Only mode
010	Module is in Internal Loopback mode
001	Module is in Disable mode
000	Module is in Normal CAN FD mode; supports mixing of full CAN FD and classic CAN 2.0 frames

Bit 4 – TXQEN Enable Transmit Queue bit(1)

Value	Description
1	Enables Transmit Message Queue (TXQ) and reserves space in RAM
0	Does not reserve space in RAM for TXQ

Bit 3 – STEF Store in Transmit Event FIFO bit(1)

Value	Description
1	Saves transmitted messages in TEF
0	Does not save transmitted messages in TEF

Bit 2 – SERRLOM Transition to Listen Only Mode on System Error bit(1)

Value	Description
1	Transitions to Listen Only mode
0	Transitions to Restricted Operation mode

Bit 1 – ESIGM Transmit ESI in Gateway Mode bit(1)

Value	Description
1	ESI is transmitted as recessive when ESI of the message is high or CAN controller is error passive
0	ESI reflects error status of CAN controller

Bit 0 – RTXAT Restrict Retransmission Attempts bit(1)

Value	Description
1	Restricted retransmission attempts, uses TXAT[1:0] bits (C1TXQCONH[6:5])
0	Unlimited number of retransmission attempts, TXAT[1:0] bits will be ignored

Value	Description
111 1111	Length is 128 x T_Q
. . .	
000 0000	Length is 1 x T_Q

Bits 6:0 – SJW[6:0] Synchronization Jump Width bits(1)

Value	Description
111 1111	Length is 128 x T_Q
. . .	
000 0000	Length is 1 x T_Q

Bit 9 – EDGFLTEN Enable Edge Filtering During Bus Integration State bit(1)

Value	Description
1	Edge filtering is enabled according to ISO11898-1:2015
0	Edge filtering is disabled

Bit 8 – SID11EN Enable 12-Bit SID in CAN FD Base Format Messages bit(1)

Value	Description
1	RRS is used as SID11 in CAN FD base format messages: SID[11:0] = {SID[10:0], SID11}
0	Does not use RRS; SID[10:0]

Bits 1:0 – TDCMOD[1:0] Transmitter Delay Compensation Mode bits (Secondary Sample Point (SSP))(1)

Value	Description
10-11	Auto: Measures delay and adds TSEG1[4:0] (C1DBTCFGH[4:0]), adds TDCO[6:0]
01	Manual: Does not measure, uses TDCV[5:0] + TDCO[6:0] from register
00	Disabled

Bit 2 – TSRES Timestamp Reset bit (CAN FD frames only)

Value	Description
1	At sample point of the bit following the FDF bit
0	At sample point of Start-of-Frame (SOF)

Bit 1 – TSEOF Timestamp End-of-Frame (EOF) bit

Value	Description
1	Timestamp when frame is taken valid (11898-1 10.7): • RX no error until last, but one bit of EOF • TX no error until the end of EOF
0	Timestamp at “beginning” of frame: • Classical Frame: At sample point of SOF • FD Frame: see TSRES bit

Bit 0 – TBCEN Time Base Counter Enable bit

Value	Description
1	Enables TBC
0	Stops and resets TBC

Bits 7:1 – TXREQ[7:1] Message Send Request bits

TXEN = 1 (object configured as a transmit object):
Setting this bit to '1' requests sending a message. The bit will automatically clear when the message(s) queued in the object is (are) successfully sent. This bit can NOT be used for aborting a transmission.

TXEN = 0 (object configured as a receive object):
This bit has no effect.

Bit 0 – TXREQ0 Transmit Queue Message Send Request bit

Setting this bit to '1' requests sending a message. The bit will automatically clear when the message(s) queued in the object is (are) successfully sent. This bit can NOT be used for aborting a transmission.

Bit 5 – NCRCERR Received Message with CRC Incorrect Checksum bit
The CRC checksum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data.

Bit 4 – NSTUFERR Received Message with Illegal Sequence bit
More than five equal bits in a sequence have occurred in a part of a received message where this is not allowed.

Bit 3 – NFORMERR Received Frame Fixed Format bit
A fixed format part of a received frame has the wrong format.

Bit 2 – NACKERR Transmitted Message Not Acknowledged bit
Transmitted message was not Acknowledged.

Bit 1 – NBIT1ERR Transmitted Message Recessive Level bit
During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.

Bit 0 – NBIT0ERR Transmitted Message Dominant Level bit
During the transmission of a message (or Acknowledge bit, active error flag or overload flag), the device wanted to send a dominant level (data or identifier bit of logical value '0'), but the monitored bus value was recessive. During bus off recovery, this status is set each time a sequence of 11 recessive bits has been monitored. This enables the

Bit 10 – FRESET FIFO Reset bit

Value	Description
1	FIFO will be reset when bit is set, cleared by hardware when FIFO is reset; user should poll whether this bit is clear before taking any action
0	No effect

Bit 9 – TXREQ Message Send Request bit

TXEN = 0 (FIFO configured as a receive FIFO):
This bit has no effect.
TXEN = 1 (FIFO configured as a transmit FIFO):

Value	Description
1	Requests sending a message; the bit will automatically clear when all the messages queued in the FIFO are successfully sent
0	Clearing the bit to '0' while set ('1') will request a message abort

Bit 8 – UINC Increment Head/Tail bit

TXEN = 1 (FIFO configured as a transmit FIFO):
When this bit is set, the FIFO head will increment by a single message.
TXEN = 0 (FIFO configured as a receive FIFO):
When this bit is set, the FIFO tail will increment by a single message.

Bit 7 – TXEN TX/RX Buffer Selection bit

Value	Description
1	Transmits message object
0	Receives message object

Bit 6 – RTREN Auto-Remote Transmit (RTR) Enable bit

Value	Description
1	When a Remote Transmit is received, TXREQ will be set
0	When a Remote Transmit is received, TXREQ will be unaffected

Bit 5 – RXTSEN Received Message Timestamp Enable bit(1)

Value	Description
1	Captures timestamp in received message object in RAM
0	Does not capture timestamp

Bit 4 – TXATIE Transmit Attempts Exhausted Interrupt Enable bit

Value	Description
1	Enables interrupt
0	Disables interrupt

Bit 3 – RXOVIE Overflow Interrupt Enable bit

Value	Description
1	Interrupt is enabled for overflow event
0	Interrupt is disabled for overflow event

Bit 2 – TFERFFIE Transmit/Receive FIFO Empty/Full Interrupt Enable bit

TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Empty Interrupt Enable.
1 = Interrupt is enabled for FIFO empty
0 = Interrupt is disabled for FIFO empty
TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Full Interrupt Enable.
1 = Interrupt is enabled for FIFO full
0 = Interrupt is disabled for FIFO full

TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Half Empty Interrupt Enable.
1 = Interrupt is enabled for FIFO half empty
0 = Interrupt is disabled for FIFO half empty
TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Half Full Interrupt Enable.
1 = Interrupt is enabled for FIFO half full
0 = Interrupt is disabled for FIFO half full

Bit 0 – TFNRFNIE Transmit/Receive FIFO Not Full/Not Empty Interrupt Enable bit

TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Not Full Interrupt Enable.
1 = Interrupt is enabled for FIFO not full
0 = Interrupt is disabled for FIFO not full
TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Not Empty Interrupt Enable.
1 = Interrupt is enabled for FIFO not empty

Name: C1FIFOSTAx
Offset: 0x720, 0x72C, 0x738, 0x744, 0x750, 0x75C, 0x768

Notes:

1. FIFOCI[4:0] bits give a zero-indexed value to the message in the FIFO. If the FIFO is four messages deep (FSIZE[4:0] = 3), FIFOCIx will take on a value of 0 to 3, depending on the state of the FIFO.
2. These bits are updated when a message completes (or aborts) or when the FIFO is reset.
3. This bit is reset on any read of this register or when the TXQ is reset. The bits are cleared when TXREQ is set or using an SPI write.

TXEN = 0 (FIFO configured as a receive buffer):
A read of this register will return an index to the message that the FIFO will use to save the next message.

Bit 7 – TXABT Message Aborted Status bit(3)

Value	Description
1	Message was aborted
0	Message completed successfully

Bit 6 – TXLARB Message Lost Arbitration Status bit(2)

Value	Description
1	Message lost arbitration while being sent
0	Message did not lose arbitration while being sent

Bit 5 – TXERR Error Detected During Transmission bit(2)

Value	Description
1	A bus error occurred while the message was being sent
0	A bus error did not occur while the message was being sent

Bit 4 – TXATIF Transmit Attempts Exhausted Interrupt Pending bit

TXEN = 0 (FIFO configured as a receive buffer):

Bit 10 – FRESET FIFO Reset bit

Value	Description
1	FIFO will be reset when bit is set, cleared by hardware when FIFO is reset; user should poll whether this bit is clear before taking any action
0	No effect

Bit 9 – TXREQ Message Send Request bit

TXEN = 0 (FIFO configured as a receive FIFO):
This bit has no effect.
TXEN = 1 (FIFO configured as a transmit FIFO):

Value	Description
1	Requests sending a message; the bit will automatically clear when all the messages queued in the FIFO are successfully sent
0	Clearing the bit to '0' while set ('1') will request a message abort

Bit 8 – UINC Increment Head/Tail bit

TXEN = 1 (FIFO configured as a transmit FIFO):
When this bit is set, the FIFO head will increment by a single message.
TXEN = 0 (FIFO configured as a receive FIFO):
When this bit is set, the FIFO tail will increment by a single message.

Bit 7 – TXEN TX/RX Buffer Selection bit

Value	Description
1	Transmits message object
0	Receives message object

Bit 6 – RTREN Auto-Remote Transmit (RTR) Enable bit

Value	Description
1	When a Remote Transmit is received, TXREQ will be set
0	When a Remote Transmit is received, TXREQ will be unaffected

Bit 5 – RXTSEN Received Message Timestamp Enable bit(1)

Value	Description
1	Captures timestamp in received message object in RAM
0	Does not capture timestamp

Bit 4 – TXATIE Transmit Attempts Exhausted Interrupt Enable bit

Value	Description
1	Enables interrupt
0	Disables interrupt

Bit 3 – RXOVIE Overflow Interrupt Enable bit

Value	Description
1	Interrupt is enabled for overflow event
0	Interrupt is disabled for overflow event

Bit 2 – TFERFFIE Transmit/Receive FIFO Empty/Full Interrupt Enable bit

TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Empty Interrupt Enable.
1 = Interrupt is enabled for FIFO empty
0 = Interrupt is disabled for FIFO empty
TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Full Interrupt Enable.
1 = Interrupt is enabled for FIFO full
0 = Interrupt is disabled for FIFO full

Bit 1 – TFHRFHIE Transmit/Receive FIFO Half Empty/Half Full Interrupt Enable bit

TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Half Empty Interrupt Enable.
1 = Interrupt is enabled for FIFO half empty
0 = Interrupt is disabled for FIFO half empty
TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Half Full Interrupt Enable.
1 = Interrupt is enabled for FIFO half full
0 = Interrupt is disabled for FIFO half full

Bit 0 – TFNRFNIE Transmit/Receive FIFO Not Full/Not Empty Interrupt Enable bit

TXEN = 1 (FIFO configured as a transmit FIFO):
Transmit FIFO Not Full Interrupt Enable.
1 = Interrupt is enabled for FIFO not full
0 = Interrupt is disabled for FIFO not full
TXEN = 0 (FIFO configured as a receive FIFO):
Receive FIFO Not Empty Interrupt Enable.
1 = Interrupt is enabled for FIFO not empty
0 = Interrupt is disabled for FIFO not empty

Offset: 0x720, 0x72C, 0x738, 0x744, 0x750, 0x75C, 0x768

Notes:

1. FIFOCI[4:0] bits give a zero-indexed value to the message in the FIFO. If the FIFO is four messages deep (FSIZE[4:0] = 3), FIFOCIx will take on a value of 0 to 3, depending on the state of the FIFO.
2. These bits are updated when a message completes (or aborts) or when the FIFO is reset.
3. This bit is reset on any read of this register or when the TXQ is reset. The bits are cleared when TXREQ is set or using an SPI write.

12. High-Resolution PWM with Fine Edge Placement

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"High-Resolution PWM with Fine Edge Placement"** (www.microchip.com/DS70005320) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The High-Speed PWM (HSPWM) module is a Pulse-Width Modulated (PWM) module to support both motor control and power supply applications. This flexible module provides features to support many types of Motor Control (MC) and Power Control (PC) applications, including:

- AC-to-DC Converters
- DC-to-DC Converters
- AC and DC Motors: BLDC, PMSM, ACIM, SRM, etc.
- Inverters
- Battery Chargers
- Digital Lighting
- Power Factor Correction (PFC)

Table 12-1. PWM Output Availability

Package Type	Total PGx Instances	Dedicated Outputs	Dedicated + PPS Outputs
100-pin	12	12 pairs	12 pairs
80-pin	8	8 pairs	8 pairs
64-pin	8	8 pairs	8 pairs
48-Pin	8	8 pairs	8 pairs

12.1 Features

- Operating modes:
  - Independent Edge mode
  - Variable Phase PWM mode
  - Center-Aligned mode
  - Double-Update Center-Aligned mode
  - Dual Edge Center-Aligned mode
  - Dual PWM mode
- Output modes:
  - Complementary
  - Independent
  - Push-Pull
- Dead-Time Generator
- Leading-Edge Blanking (LEB)
- Output Override for Fault Handling
- Flexible Period/Duty Cycle Updating Options
- Programmable Control Inputs (PCI)
- Advanced Triggering Options
- Six Combinatorial Logic Outputs
- Six PWM Event Outputs

12.2 Architecture Overview

The PWM module consists of a common set of controls and features, and multiple instantiations of PWM Generators (PGs). Each PWM Generator can be independently configured or multiple PWM Generators can be used to achieve complex multiphase systems. PWM Generators can also be used to implement sophisticated triggering, protection and logic functions. A high-level block diagram is shown in Figure 12-1. In addition, this device family has another identical PWM module to accommodate additional PWM Generators. This additional module has been designated as an Auxiliary PWM Module (Figure 12-2). For devices with more than 8 PWM Generators, 8 PWM Generators are regular PWM Generators and any additional generators are APWM Generators.

12.3 Lock and Write Restrictions

The LOCK bit (PCLKCON[8]) may be set in software to block writes to certain registers. For more information, refer to **"High-Resolution PWM with Fine Edge Placement"** (www.microchip.com/DS70005320).

The following lock/unlock sequence is required to set or clear the LOCK bit.

1. Write 0x55 to NVMKEY.
2. Write 0xAA to NVMKEY.
3. Clear (or set) the LOCK bit (PCLKCON[8]) as a single operation.

In general, modifications to configuration controls should not be done while the module is running, as indicated by the ON bit (PGxCONL[15]) being set.

12.4 PWM4H/L Output on Peripheral Pin Select

All devices support the capability to output PWM4H and PWM4L signals via Peripheral Pin Select (PPS) on to any "RPn" pin. This feature is intended for lower pin count devices that do not have PWM4H/L on dedicated pins.

Configuration bit, DUPWM (FDEVOP1[12]), provides the option to disable the fixed pin PWM4L/H functions when using the PPS. Clearing the DUPPWM bit will disable PWM4 function and allow the pin to be used for another purpose. Leaving the DUPPWM set (default) will output PWM4 on both fixed pin and PPS outputs. The output port enable bits, PENH and PENL (PGxIOCONH[3:2]), control output function for both dedicated and PPS pins outputs

If PWM4H/L PPS output functions are used on devices that also have fixed PWM4H/L pins, the output signal will be present on both dedicated and "RPn" pins. The output port enable bits, PENH and PENL (PGxIOCONH[3:2]), control both dedicated and PPS pins together; it is not possible to disable the dedicated pins and use only PPS.

Given the natural priority of the "RPn" functions above that of the PWM, it is possible to use the PPS output functions on the dedicated PWM4H/L pins, while the PWM4 signals are routed to other pins via PPS. Any of the peripheral outputs listed in Table 8-5, with the exception of 'Default Port', can be used. Input functions, including the ports and peripherals listed in 8.7. Virtual Connections, cannot be used through the "RPn" function on dedicated PWM4H/L pins when PWM4 is active.

12.5 PWM Control/Status Registers

There are two categories of Special Function Registers (SFRs) used to control the operation of the PWM module:

- Common, shared by all PWM Generators
- PWM Generator-specific
- Auxiliary PWM which is used as additional PWM Generators

An 'x' in the register name denotes an instance of a PWM Generator.

A 'y' in the register name denotes an instance of the common function.

An 'A' in the register name denotes an instance of the Auxiliary PWM.

12.6.1 Auxiliary PWM Clock Control Register

Name: APCLKCON
Offset: 0x1D2

Notes:

1. A device-specific unlock sequence must be performed before this bit can be cleared.
2. Changing the MCLKSEL[1:0] bits while ON (PGxCONL[15]) = 1 is not recommended.

Bit	15	14	13	12	11	10	9	8
	HRRDY	HRERR						LOCK
Access	R/W	R/W						R/W
Reset	0	0						0

Bit	7	6	5	4	3	2	1	0
			DIVSEL[1:0]				MCLKSEL[1:0]	
Access			R/W	R/W			R/W	R/W
Reset			0	0			0	0

Bit 15 – HRRDY High-Resolution Ready bit

Value	Description
1	The high-resolution circuitry is ready
0	The high-resolution circuitry is not ready

Bit 14 – HRERR High-Resolution Error bit

Value	Description
1	An error has occurred; APWM signals will have limited resolution
0	No error has occurred; APWM signals will have full resolution when HRRDY = 1

Bit 8 – LOCK Lock bit(1)

Value	Description
1	Write-protected registers and bits are locked
0	Write-protected registers and bits are unlocked

Bits 5:4 – DIVSEL[1:0] PWM Clock Divider Selection bits

Value	Description
11	Divide ratio is 1:16
10	Divide ratio is 1:8
01	Divide ratio is 1:4
00	Divide ratio is 1:2

Bits 1:0 – MCLKSEL[1:0] PWM Main Clock Selection bits(2)

Value	Description
11	AF_{PLLO} – Auxiliary PLL post-divider output
10	F_{PLLO} – Primary PLL post-divider output
01	$AF_{VCO}/2$ – Auxiliary VCO/2
00	F_{OSC}

12.6.11 Auxiliary PWM Event Output Control Register y

Name: APWMEVTy(5)
Offset: 0x1F0, 0x1F2, 0x1F4, 0x1F6, 0x1F8, 0x1FA

Notes:

1. The event signal is stretched using the peripheral clock because different APGs may be operating from different clock sources. The leading edge of the event pulse is produced in the clock domain of the APWM Generator. The trailing edge of the stretched event pulse is produced in the peripheral clock domain.
2. No event will be produced if the selected APWM Generator is not present.
3. This is the APWM Generator output signal prior to Output mode logic and any output override logic.
4. This signal should be the APGx_clk domain signal prior to any synchronization into the system clock domain.
5. 'y' denotes a common instance (A-F).

Bit 15 – EVTyOEN APWM Event Output Enable bit

Value	Description
1	Event output signal is output on APWMEVTy pin
0	Event output signal is internal only

Bit 14 – EVTyPOL APWM Event Output Polarity bit

Value	Description
1	Event output signal is active-low
0	Event output signal is active-high

Bit 13 – EVTySTRD APWM Event Output Stretch Disable bit

Value	Description
1	Event output signal pulse width is not stretched
0	Event output signal is stretched to eight APWM clock cycles minimum(1)

Bit 12 – EVTySYNC APWM Event Output Sync bit

Event output signal pulse will be two system clocks when this bit is set and EVTySTRD = 1.

Value	Description
1	Event output signal is synchronized to the system clock
0	Event output is not synchronized to the system clock

Bits 7:4 – EVTySEL[3:0] APWM Event Selection bits

Value	Description
1111	High-resolution error event signal

12.6.12 Auxiliary PWM Generator x Control Register Low

Name: APGxCONL
Offset: 0x1FC, 0x232, 0x268, 0x29E

Note:

1. The APWM Generator time base operates from the frequency scaling circuit clock, effectively scaling the duty cycle and period of the APWM Generator output.

Bit 7 – HREN APWM Generator x High-Resolution Enable bit

Value	Description
1	APWM Generator x operates in High-Resolution mode
0	APWM Generator x operates in Standard Resolution mode

Bits 4:3 – CLKSEL[1:0] Clock Selection bits

Value	Description
11	APWM Generator uses Host clock scaled by frequency scaling circuit(1)
10	APWM Generator uses Host clock divided by clock divider circuit(1)
01	APWM Generator uses Host clock selected by the MCLKSEL[1:0] (APCLKCON[1:0]) control bits
00	No clock selected, APWM Generator is in the Lowest Power state (default)

Bits 2:0 – MODSEL[2:0] Mode Selection bits

Value	Description

12.6.13 Auxiliary PWM Generator x Control Register High

Name: APGxCONH
Offset: 0x1FE, 0x234, 0x26A, 0x2A0

Notes:

1. The PCI selected Sync signal is always available to be OR'd with the selected SOC signal per the SOCS[3:0] bits if the PCI Sync function is enabled.
2. The source selected by the SOCS[3:0] bits MUST operate from the same clock source as the local APWM Generator. If not, the source must be routed through the PCI Sync logic so the trigger signal may be synchronized to the APWM Generator clock domain.
3. APWM Generators are grouped into groups of four: APG1-APG4 and APG5-APG8, if available. Any generator within a group of four may be used to trigger another generator within the same group.

Value	Description
1	APWM Generator uses the AMDC register instead of APGxDC
0	APWM Generator uses the APGxDC register

Bit 14 – MPERSEL Main Period Register Select bit

Value	Description
1	APWM Generator uses the AMPER register instead of APGxPER
0	APWM Generator uses the APGxPER register

Bit 13 – MPHSEL Main Phase Register Select bit

Value	Description
1	APWM Generator uses the AMPHASE register instead of APGxPHASE
0	APWM Generator uses the APGxPHASE register

Bit 11 – MSTEN Main Update Enable bit

Value	Description
1	APWM Generator broadcasts software set/clear of the UPDATE status bit and EOC signal to other APWM Generators
0	APWM Generator does not broadcast the UPDATE status bit state or EOC signal

Bits 10:8 – UPMOD[2:0] APWM Buffer Update Mode Selection bits

Bit 15 – SEVT PCI Sync Event bit

Value	Description
1	A PCI Sync event has occurred (rising edge on PCI Sync output or PCI Sync output is high when module is enabled)
0	No PCI Sync event has occurred

Bit 14 – FLTEVT PCI Fault Active Status bit

Value	Description
1	A Fault event has occurred (rising edge on PCI Fault output or PCI Fault output is high when module is enabled)
0	No Fault event has occurred

Bit 13 – CLEVT PCI Current Limit Status bit

Value	Description
1	A PCI current limit event has occurred (rising edge on PCI current limit output or PCI current limit output is high when module is enabled)
0	No PCI current limit event has occurred

Bit 12 – FFEVT PCI Feed-Forward Active Status bit

Value	Description
1	A PCI feed-forward event has occurred (rising edge on PCI feed-forward output or PCI feed-forward output is high when module is enabled)
0	No PCI feed-forward event has occurred

Bit 11 – SACT PCI Sync Status bit

Value	Description
1	PCI Sync output is active
0	PCI Sync output is inactive

Bit 10 – FLTACT PCI Fault Active Status bit

Value	Description
1	PCI Fault output is active
0	PCI Fault output is inactive

Bit 9 – CLACT PCI Current Limit Status bit

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
1	PCI current limit output is active
0	PCI current limit output is inactive

Bit 8 – FFACT PCI Feed-Forward Active Status bit

Value	Description
1	PCI feed-forward output is active
0	PCI feed-forward output is inactive

Bit 7 – TRSET APWM Generator Software Trigger Set bit

User software writes a '1' to this bit location to trigger a APWM Generator cycle. The bit location always reads as '0'. The TRIG bit will indicate '1' when the APWM Generator is triggered.

Bit 6 – TRCLR APWM Generator Software Trigger Clear bit

User software writes a '1' to this bit location to stop a APWM Generator cycle. The bit location always reads as '0'. The TRIG bit will indicate '0' when the APWM Generator is not triggered.

Bit 5 – CAP Capture Status bit(1)

Value	Description
1	APWM Generator time base value has been captured in APGxCAP
0	No capture has occurred

Bit 4 – UPDATE APWM Data Register Update Status/Control bit

Value	Description
1	APWM Data register update is pending – user Data registers are not writable
0	No APWM Data register update is pending

Bit 3 – UPDREQ APWM Data Register Update Request bit

User software writes a '1' to this bit location to request a APWM Data register update. The bit location always reads as '0'. The UPDATE status bit will indicate '1' when an update is pending.

Bit 2 – STEER Output Steering Status bit (Push-Pull Output mode only)

Value	Description
1	APWM Generator is in 2nd cycle of Push-Pull mode
0	APWM Generator is in 1st cycle of Push-Pull mode

Bit 1 – CAHALF Half Cycle Status bit (Center-Aligned modes only)

Value	Description
1	APWM Generator is in 2nd half of time base cycle
0	APWM Generator is in 1st half of time base cycle

Bit 0 – TRIG APWM Trigger Status bit

Value	Description
1	APWM Generator is triggered and APWM cycle is in progress
0	No APWM cycle is in progress

Value	Description
1	If PCI current limit is active, then the APWMxH and APWMxL output signals are inverted (bit flipping), and the CLDAT[1:0] bits are not used
0	If PCI current limit is active, then the CLDAT[1:0] bits define the APWM output levels

Bit 14 – SWAP Swap APWM Signals to APWMxH and APWMxL Device Pins bit

Value	Description
1	The APWMxH signal is connected to the APWMxL pin and the APWMxL signal is connected to the APWMxH pin
0	APWMxH/L signals are mapped to their respective pins

Bit 13 – OVRENH User Override Enable for APWMxH Pin bit

Value	Description
1	OVRDAT1 provides data for output on the APWMxH pin
0	APWM Generator provides data for the APWMxH pin

Bit 12 – OVRENL User Override Enable for APWMxL Pin bit

Value	Description
1	OVRDAT0 provides data for output on the APWMxL pin
0	APWM Generator provides data for the APWMxL pin

Bits 11:10 – OVRDAT[1:0] Data for APWMxH/APWMxL Pins if Override is Enabled bits
If OVERENH = 1, then OVRDAT1 provides data for APWMxH.
If OVERENL = 1, then OVRDAT0 provides data for APWMxL.

Bits 9:8 – OSYNC[1:0] User Output Override Synchronization Control bits

Value	Description
11	Reserved
10	User output overrides via the OVRENH/L and OVRDAT[1:0] bits occur when specified by the UPDMOD[2:0] bits in the APGxCONH register
01	User output overrides via the OVRENH/L and OVRDAT[1:0] bits occur immediately (as soon as possible)
00	User output overrides via the OVRENH/L and OVRDAT[1:0] bits are synchronized to the local APWM time base (next Start-of-Cycle)

Bits 7:6 – FLTDAT[1:0] Data for APWMxH/APWMxL Pins if Fault Event is Active bits
If Fault is active, then FLTDAT1 provides data for APWMxH.
If Fault is active, then FLTDAT0 provides data for APWMxL.

Bits 5:4 – CLDAT[1:0] Data for APWMxH/APWMxL Pins if Current Limit Event is Active bits
If current limit is active, then CLDAT1 provides data for APWMxH.

If current limit is active, then CLDAT0 provides data for APWMxL.

Bits 3:2 – FFDAT[1:0] Data for APWMxH/APWMxL Pins if Feed-Forward Event is Active bits
If feed-forward is active, then FFDAT1 provides data for APWMxH.
If feed-forward is active, then FFDAT0 provides data for APWMxL.

Bits 1:0 – DBDAT[1:0] Data for APWMxH/APWMxL Pins if Debug Mode is Active and PTFRZ = 1 bits
If Debug mode is active and PTFRZ = 1, then DBDAT1 provides data for APWMxH.
If Debug mode is active and PTFRZ = 1, then DBDAT0 provides data for APWMxL.

12.6.42 PWM Event Output Control Register y

Name: PWMEVTy(5)
Offset: 0x031E, 0x0320, 0x0322, 0x0324, 0x0326, 0x0328

Notes:

1. The event signal is stretched using the peripheral clock because different PGs may be operating from different clock sources. The leading edge of the event pulse is produced in the clock domain of the PWM Generator. The trailing edge of the stretched event pulse is produced in the peripheral clock domain.
2. No event will be produced if the selected PWM Generator is not present.
3. This is the PWM Generator output signal prior to Output mode logic and any output override logic.
4. This signal should be the PGx_clk domain signal prior to any synchronization into the system clock domain.
5. 'y' denotes a common instance (A-F).

Bit 15 – EVTyOEN PWM Event Output Enable bit

Value	Description
1	Event output signal is output on PWMEVTy pin
0	Event output signal is internal only

Bit 14 – EVTyPOL PWM Event Output Polarity bit

Value	Description
1	Event output signal is active-low
0	Event output signal is active-high

Bit 13 – EVTySTRD PWM Event Output Stretch Disable bit

Value	Description
1	Event output signal pulse width is not stretched
0	Event output signal is stretched to eight PWM clock cycles minimum(1)

Bit 12 – EVTySYNC PWM Event Output Sync bit

Event output signal pulse will be two system clocks when this bit is set and EVTySTRD = 1.

Value	Description
1	Event output signal is synchronized to the system clock
0	Event output is not synchronized to the system clock

Bits 7:4 – EVTySEL[3:0] PWM Event Selection bits

Value	Description
1111	High-resolution error event signal

12.6.44 PWM Generator x Control Register Low

Name: PGxCONL
Offset: 0x32A, 0x360, 0x396, 0x3CC

Note:

1. The PWM Generator time base operates from the frequency scaling circuit clock, effectively scaling the duty cycle and period of the PWM Generator output.

Bit 15 – ON Enable bit

Value	Description
1	PWM Generator is enabled
0	PWM Generator is not enabled

Bits 10:8 – TRGCNT[2:0] Trigger Count Select bits

Value	Description
111	PWM Generator produces eight PWM cycles after triggered
110	PWM Generator produces seven PWM cycles after triggered
101	PWM Generator produces six PWM cycles after triggered
100	PWM Generator produces five PWM cycles after triggered
011	PWM Generator produces four PWM cycles after triggered
010	PWM Generator produces three PWM cycles after triggered
001	PWM Generator produces two PWM cycles after triggered
000	PWM Generator produces one PWM cycle after triggered

Bit 7 – HREN PWM Generator x High-Resolution Enable bit

Value	Description
1	PWM Generator x operates in High-Resolution mode
0	PWM Generator x operates in Standard Resolution mode

Bits 4:3 – CLKSEL[1:0] Clock Selection bits

Value	Description
11	PWM Generator uses Host clock scaled by frequency scaling circuit(1)
10	PWM Generator uses Host clock divided by clock divider circuit(1)
01	PWM Generator uses Host clock selected by the MCLKSEL[1:0] (PCLKCON[1:0]) control bits
00	No clock selected, PWM Generator is in Lowest Power state (default)

Bits 2:0 – MODSEL[2:0] Mode Selection bits

Value	Description
111	Dual Edge Center-Aligned PWM mode (interrupt/register update twice per cycle)
110	Dual Edge Center-Aligned PWM mode (interrupt/register update once per cycle)
101	Double-Update Center-Aligned PWM mode
100	Center-Aligned PWM mode

12.6.45 PWM Generator x Control Register High

Name: PGxCONH
Offset: 0x32C, 0x362, 0x398, 0x3CE, 0x404, 0x43A, 0x470, 0x4A6

Notes:

1. The PCI selected Sync signal is always available to be OR'd with the selected SOC signal per the SOCS[3:0] bits if the PCI Sync function is enabled.
2. The source selected by the SOCS[3:0] bits MUST operate from the same clock source as the local PWM Generator. If not, the source must be routed through the PCI Sync logic so the trigger signal may be synchronized to the PWM Generator clock domain.
3. PWM Generators are grouped into groups of four: PG1-PG4 and PG5-PG8, if available. Any generator within a group of four may be used to trigger another generator within the same group.

Value	Description
1	PWM Generator uses the MDC register instead of PGxDC
0	PWM Generator uses the PGxDC register

Bit 14 – MPERSEL Main Period Register Select bit

Value	Description
1	PWM Generator uses the MPER register instead of PGxPER
0	PWM Generator uses the PGxPER register

Bit 13 – MPHSEL Main Phase Register Select bit

Value	Description
1	PWM Generator uses the MPHASE register instead of PGxPHASE
0	PWM Generator uses the PGxPHASE register

Bit 11 – MSTEN Main Update Enable bit

Value	Description
1	PWM Generator broadcasts software set/clear of the UPDATE status bit and EOC signal to other PWM Generators
0	PWM Generator does not broadcast the UPDATE status bit state or EOC signal

Bits 10:8 – UPMOD[2:0] PWM Buffer Update Mode Selection bits

Bit 7 – Reserved Maintain as '0'

Bit 6 – TRGMOD PWM Generator Trigger Mode Selection bit

Value	Description

12.6.46 PWM Generator x Status Register

Name: PGxSTAT
Offset: 0x32E, 0x364, 0x39A, 0x3D0

Note:

1. User software may write a '1' to CAP as a request to initiate a software capture. The CAP status bit will be set when the capture event has occurred. No further captures will occur until CAP is cleared by software.

Legend: C = Clearable bit; HS = Hardware Settable bit

Bit 15 – SEVT PCI Sync Event bit

Value	Description
1	A PCI Sync event has occurred (rising edge on PCI Sync output or PCI Sync output is high when module is enabled)
0	No PCI Sync event has occurred

Bit 14 – FLTEVT PCI Fault Active Status bit

Value	Description
1	A Fault event has occurred (rising edge on PCI Fault output or PCI Fault output is high when module is enabled)
0	No Fault event has occurred

Bit 13 – CLEVT PCI Current Limit Status bit

Value	Description
1	A PCI current limit event has occurred (rising edge on PCI current limit output or PCI current limit output is high when module is enabled)
0	No PCI current limit event has occurred

Bit 12 – FFEVT PCI Feed-Forward Active Status bit

Value	Description
1	A PCI feed-forward event has occurred (rising edge on PCI feed-forward output or PCI feed-forward output is high when module is enabled)
0	No PCI feed-forward event has occurred

Bit 11 – SACT PCI Sync Status bit

Value	Description
1	PCI Sync output is active
0	PCI Sync output is inactive

Bit 10 – FLTACT PCI Fault Active Status bit

Value	Description
1	PCI Fault output is active
0	PCI Fault output is inactive

Bit 9 – CLACT PCI Current Limit Status bit

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
1	PCI current limit output is active
0	PCI current limit output is inactive

Bit 8 – FFACT PCI Feed-Forward Active Status bit

Value	Description
1	PCI feed-forward output is active
0	PCI feed-forward output is inactive

Bit 7 – TRSET PWM Generator Software Trigger Set bit

User software writes a '1' to this bit location to trigger a PWM Generator cycle. The bit location always reads as '0'. The TRIG bit will indicate '1' when the PWM Generator is triggered.

Bit 6 – TRCLR PWM Generator Software Trigger Clear bit

User software writes a '1' to this bit location to stop a PWM Generator cycle. The bit location always reads as '0'. The TRIG bit will indicate '0' when the PWM Generator is not triggered.

Bit 5 – CAP Capture Status bit(1)

Value	Description
1	PWM Generator time base value has been captured in PGxCAP
0	No capture has occurred

Bit 4 – UPDATE PWM Data Register Update Status/Control bit

Value	Description
1	PWM Data register update is pending – user Data registers are not writable
0	No PWM Data register update is pending

Bit 3 – UPDREQ PWM Data Register Update Request bit

User software writes a '1' to this bit location to request a PWM Data register update. The bit location always reads as '0'. The UPDATE status bit will indicate '1' when an update is pending.

Bit 2 – STEER Output Steering Status bit (Push-Pull Output mode only)

Value	Description
1	PWM Generator is in 2nd cycle of Push-Pull mode
0	PWM Generator is in 1st cycle of Push-Pull mode

Bit 1 – CAHALF Half Cycle Status bit (Center-Aligned modes only)

Value	Description
1	PWM Generator is in 2nd half of time base cycle
0	PWM Generator is in 1st half of time base cycle

Bit 0 – TRIG PWM Trigger Status bit

Value	Description
1	PWM Generator is triggered and PWM cycle is in progress
0	No PWM cycle is in progress

13. High-Speed, 12-Bit Analog-to-Digital Converter

Notes:

1. This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"12-Bit High-Speed, Multiple SARs A/D Converter (ADC)"** (www.microchip.com/DS70005213).
2. Some registers and associated bits described in this section may not be available on all devices due to the number of implemented ADC channels. Refer to dsPIC33CK1024MP710 Product Families for ADC channel availability on device variants.

The dsPIC33CK1024MP710 devices have a high-speed, 12-bit Analog-to-Digital Converter (ADC) that features a low conversion latency, high resolution and oversampling capabilities to improve performance in AC/DC and DC/DC power converters. The devices implement the ADC with five SAR cores, four dedicated and one shared.

The number of available channels and negative inputs is dependent on package size, as shown in the table below.

Table 13-1. ADC External Input Availability

Package Type	External Inputs	Negative Inputs	Alternate Inputs
100-Pin	AN0-AN26, AN30, AN31	ANN0-ANN4	ANA0-ANA3, ANB0-ANB3, ANC0-ANC2
80-Pin	AN0-AN23, AN30, AN31	ANN0-ANN4	ANA0-ANA3, ANB0-ANB3, ANC0-ANC2
64-Pin	AN0-AN19, AN30, AN31	ANN0-ANN2, ANN4	ANA0-ANA3, ANB0-ANB2, ANC2
48-Pin	AN0-AN18, AN30, AN31	ANN0-ANN2, ANN4	ANA0-ANA3, ANB1-ANB2, ANC2

13.1 ADC Features Overview

The high-speed, 12-bit multiple SARs Analog-to-Digital Converter (ADC) includes the following features:

- Five ADC Cores: Four Dedicated Cores and One Shared (common) Core
- User-Configurable Resolution of Up to 12 Bits
- Up to 3.5 Msps Conversion Rate per Channel at 12-Bit Resolution
- Low Latency Conversion
- Up to 28 Analog Input Channels with a Separate 16-Bit Conversion Result Register for each Input Channel
- Conversion Result can be Formatted as Unsigned or Signed Data, on a per Channel Basis, for All Channels
- Simultaneous Sampling of up to Five Analog Inputs
- Channel Scan Capability
- Multiple Conversion Trigger Options, Including:
  - PWM triggers from CPU core
  - MCCP/SCCP modules triggers
  - CLC modules triggers
  - External pin trigger event (ADTRG31)
  - Software trigger
- Four Integrated Digital Comparators with Dedicated Interrupts:
  - Multiple comparison options
  - Assignable to specific analog inputs
- Four Oversampling Filters with Dedicated Interrupts:

© 2022-2023 Microchip Technology Inc. and its subsidiaries

- Provide increased resolution
- Assignable to a specific analog input

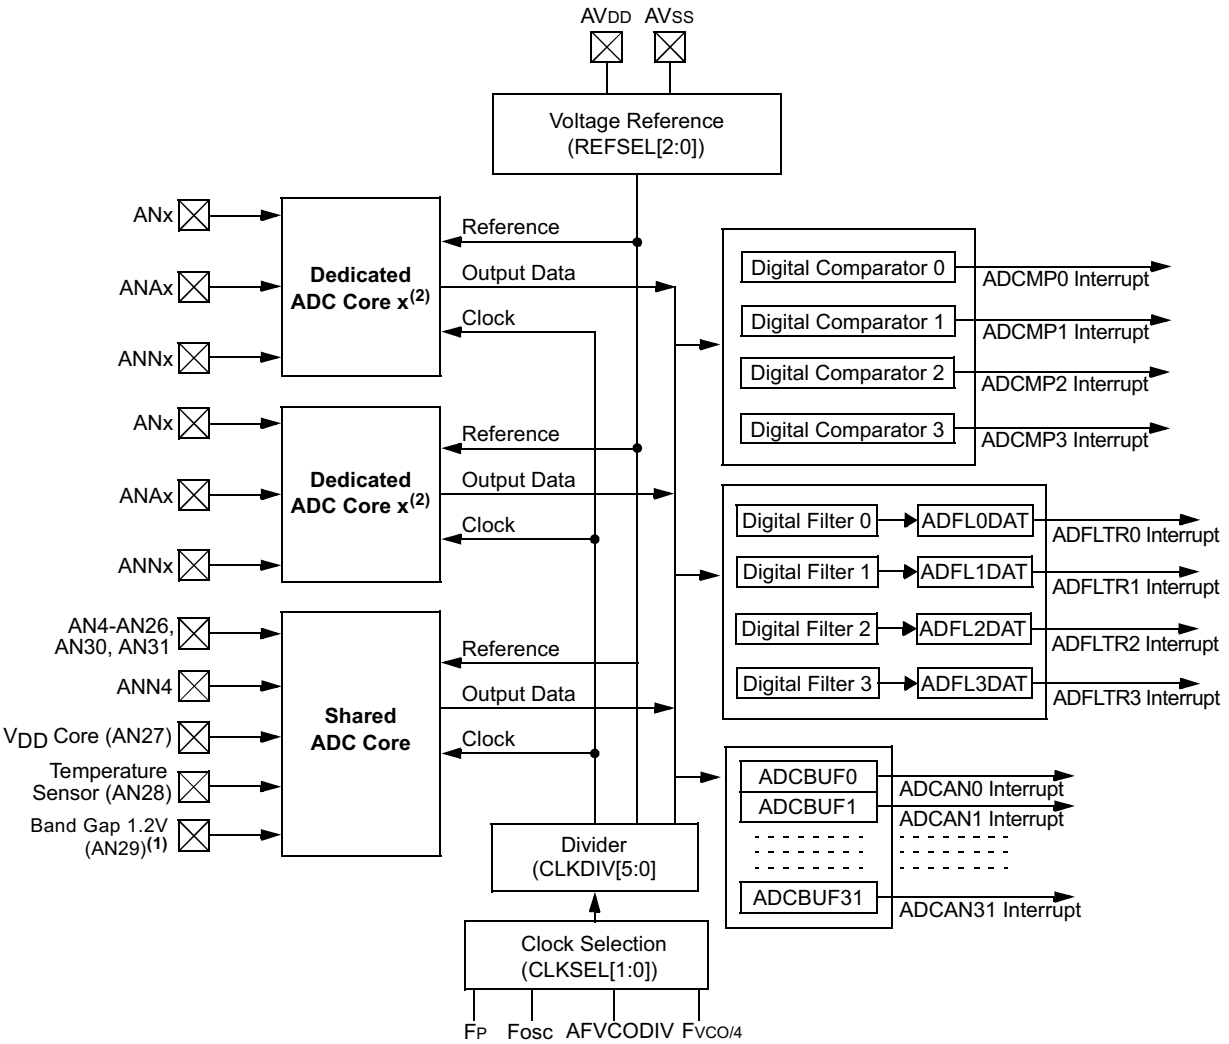

The module consists of five independent SAR ADC cores. Simplified block diagrams of the Multiple SARs 12-bit ADC are shown in Figure 13-1, Figure 13-2 and Figure 13-3.

The analog inputs (channels) are connected through multiplexers and switches to the Sample-and-Hold (S&H) circuit of the ADC core. The core uses the channel information (the output format, the Measurement mode and the input number) to process the analog sample. When conversion is complete, the result is stored in the result buffer for the specific analog input, and passed to the digital filter and digital comparator if they were configured to use data from this particular channel.

The ADC module can sample up to five inputs at a time (four inputs from the dedicated SAR cores and one from the shared SAR core). If multiple ADC inputs request conversion on the shared core, the module will convert them in a sequential manner, starting with the lowest order input.

The ADC provides each analog input the ability to specify its own trigger source. This capability allows the ADC to sample and convert analog inputs that are associated with PWM Generators operating on independent time bases.

Notes:

1. Band Gap Reference (V_{BG}) is an internal analog input and is not available on device pins.
2. Your particular device may have a different number of dedicated cores; see the device-specific data sheet, pinout figures or Table 1-1.

Note:

1. Check the device pinout diagram to verify if the pin is available on the specific device.

13.2 Temperature Sensor

The ADC channel, AN28, is connected to a forward biased diode. It can be used to measure die temperature. This diode provides a voltage output that can be monitored by the ADC.

13.3 Analog-to-Digital Converter Resources

Many useful resources are provided on the main product page of the Microchip website for the devices listed in this data sheet. This product page contains the latest updates and additional information.

13.3.1 Differential-Mode

ANNx negative external inputs are used for Differential-mode as shown in Figure 13-2. To enable Differential-mode, the DIFF bit (in the ADMODxL or ADMODxH register) is set for the corresponding channel.

13.3.2 Alternate Inputs

ANXx alternate inputs are used to provide more flexibility to the inputs of the dedicated SAR cores. To enable the use of a specific alternate input, the CxCHS[1:0] bits (in the ADCON4H register) can be set for the corresponding channel.

13.4.1 ADC Control Register 1 Low

Name: ADCON1L
Offset: 0xB00

Note:

1. Set the ADON bit only after the ADC module has been configured. Changing ADC Configuration bits when ADON = 1 will result in unpredictable behavior.

Bit 15 – ADON ADC Enable bit(1)

Value	Description
1	ADC module is enabled
0	ADC module is off

Bit 13 – ADSIDL ADC Stop in Idle Mode bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bit 11 – CVDEN CVD Enable bit

Value	Description
1	CVD module is enabled
0	CVD module is off

Bit 7 – FORM Fractional Data Output Format bit

Value	Description
1	Fractional
0	Integer

Bits 6:5 – SHRRES[1:0] Shared ADC Core Resolution Selection bits

Value	Description
11	12-bit resolution
10	10-bit resolution

13.4.3 ADC Control Register 2 Low

Name: ADCON2L
Offset: 0xB04

Note:

1. For the 6-bit shared ADC core resolution (SHRRES[1:0] = 00), the SHREISEL[2:0] settings, from '100' to '111', are not valid and should not be used. For the 8-bit shared ADC core resolution (SHRRES[1:0] = 01), the SHREISEL[2:0] settings, '110' and '111', are not valid and should not be used.

Bit 15 – REFCIE Band Gap and Reference Voltage Ready Common Interrupt Enable bit

Value	Description
1	Common interrupt will be generated when the band gap becomes ready
0	Common interrupt is disabled for the band gap ready event

Bit 14 – REFERCIE Band Gap or Reference Voltage Error Common Interrupt Enable bit

Value	Description
1	Common interrupt will be generated when a band gap or reference voltage error is detected
0	Common interrupt is disabled for the band gap and reference voltage error event

Bit 12 – EIEN Early Interrupts Enable bit

Value	Description
1	Early interrupt feature is enabled for input channel interrupts (when EISTATx flag is set)
0	Individual interrupts are generated when conversion is done (when ANxRDY flag is set)

Bit 11 – PTGEN External Conversion Request Interface bit
Setting this bit will enable the PTG to request conversion of an ADC input.

Bits 10:8 – SHREISEL[2:0] Shared Core Early Interrupt Time Selection bits(1)

Value	Description
111	Early interrupt is set, interrupt is generated eight T_{ADCORE} clocks prior to when data are ready
110	Early interrupt is set, interrupt is generated seven T_{ADCORE} clocks prior to when data are ready
101	Early interrupt is set, interrupt is generated six T_{ADCORE} clocks prior to when data are ready
100	Early interrupt is set, interrupt is generated five T_{ADCORE} clocks prior to when the data are ready
011	Early interrupt is set, interrupt is generated four T_{ADCORE} clocks prior to when data are ready
010	Early interrupt is set, interrupt is generated three T_{ADCORE} clocks prior to when data are ready
001	Early interrupt is set, interrupt is generated two T_{ADCORE} clocks prior to when data are ready
000	Early interrupt is set, interrupt is generated one T_{ADCORE} clock prior to when data are ready

Bits 6:0 – SHRADCS[6:0] Shared ADC Core Input Clock Divider bits
These bits determine the number of $T_{CORESRC}$ (Source Clock Periods) for one shared T_{ADCORE} (Core Clock Period).

Value	Description
1111111	254 Source Clock Periods
. . .	
0000011	6 Source Clock Periods

Bit 15 – REFRDY Band Gap and Reference Voltage Ready Flag bit

Value	Description
1	Band gap is ready
0	Band gap is not ready

Bit 14 – REFERR Band Gap or Reference Voltage Error Flag bit

Value	Description
1	Band gap was removed after the ADC module was enabled (ADON = 1)
0	No band gap error was detected

Bits 12:10 – CVDCAP[2:0] CVD Capacitor Setting bit

Value	Description
111	2.5 pF * Value

000	0 pF

Bits 9:0 – SHRSAMC[9:0] Shared ADC Core Sample Time Selection bits

These bits specify the number of shared ADC Core Clock Periods (T_{ADCORE}) for the shared ADC core sample time (Sample Time = (SHRSAMC[9:0] + 2) * T_{ADCORE}).

Value	Description
1111111111	1025 T_{ADCORE}

13.4.5 ADC Control Register 3 Low

Name: ADCON3L
Offset: 0xB08

Legend: HSC = Hardware Settable/Clearable bit

Bit	15	14	13	12	11	10	9	8
	REFSEL[2:0]			SUSPEND	SUSPCIE	SUSPRDY	SHRSAMP	CNVRTCH
Access	R/W	R/W	R/W	R/W	R/W	HSC/R	R/W	HSC/R
Reset	0	0	0	0	0	0	0	0

	SWLCTRG	SWCTRG	CNVCHSEL[5:0]					
Access	R/W	HSC/R	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:13 – REFSEL[2:0] ADC Reference Voltage Selection bits

Value	V_{REFH}	V_{REFL}
001-111	**Unimplemented:** Do not use	
000	AV_{DD}	AV_{SS}

Bit 12 – SUSPEND All ADC Core Triggers Disable bit

Value	Description
1	All new trigger events for the ADC core are disabled
0	The ADC core can be triggered

Bit 11 – SUSPCIE Suspend All ADC Cores Common Interrupt Enable bit

Value	Description
1	Common interrupt will be generated when ADC core triggers are suspended (SUSPEND bit = 1) and all previous conversions are finished (SUSPRDY bit becomes set)
0	Common interrupt is not generated for suspend ADC cores event

Bit 10 – SUSPRDY ADC Core Suspended Flag bit

Value	Description
1	The ADC core is suspended (SUSPEND bit = 1) and has no conversions in progress
0	The ADC core has previous conversions in progress

Bit 9 – SHRSAMP Shared ADC Core Sampling Direct Control bit

This bit should be used with the individual channel conversion trigger controlled by the CNVRTCH bit. It connects an analog input, specified by the CNVCHSEL[5:0] bits, to the shared ADC core and allows extending the sampling time. This bit is not controlled by hardware and must be cleared before the conversion starts (setting CNVRTCH to '1').

Value	Description
1	Shared ADC core samples an analog input specified by the CNVCHSEL[5:0] bits
0	Sampling is controlled by the shared ADC core hardware

Bit 8 – CNVRTCH Software Individual Channel Conversion Trigger bit

Value	Description
1	Single trigger is generated for an analog input specified by the CNVCHSEL[5:0] bits; when the bit is set, it is automatically cleared by hardware on the next instruction cycle
0	Next individual channel conversion trigger can be generated

Bit 7 – SWLCTRG Software Level-Sensitive Common Trigger bit

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Triggers are continuously generated for all channels with the software; level-sensitive common trigger selected as a source in the ADTRIGnL and ADTRIGxH registers
0	No software, level-sensitive common triggers are generated

Bit 6 – SWCTRG Software Common Trigger bit

Value	Description
1	Single trigger is generated for all channels with the software; common trigger selected as a source in the ADTRIGnL and ADTRIGxH registers; when the bit is set, it is automatically cleared by hardware on the next instruction cycle
0	Ready to generate the next software common trigger

Bits 5:0 – CNVCHSEL[5:0] Channel No. Selection for Software Individual Channel Conv. Trigger bits
These bits define a channel to be converted when the CNVRTCH bit is set.

13.4.6 ADC Control Register 3 High

Name: ADCON3H
Offset: 0xB0A

Notes:

1. The ADC input clock frequency, selected by the CLKSEL[1:0] bits, must not exceed AD67 (see Table 33-37).
2. The ADC clock frequency, after the first divider selected by the CLKDIV[5:0] bits, must not exceed AD67 (see Table 33-37).

Bit	15	14	13	12	11	10	9	8
	CLKSEL[1:0]		CLKDIV[5:0]					
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	7	6	5	4	3	2	1	0
	SHREN				C3EN	C2EN	C1EN	C0EN
Access	R/W				R/W	R/W	R/W	R/W
Reset	0				0	0	0	0

Bits 15:14 – CLKSEL[1:0] ADC Module Clock Source Selection bits(1)

Value	Description
11	$F_{VCO}/4$
10	AF_{VCODIV}
01	F_{OSC}
00	F_P(Peripheral Clock)

Bits 13:8 – CLKDIV[5:0] ADC Module Clock Source Divider bits(2)

The divider forms a $T_{CORESRC}$ clock used by all ADC cores (shared and dedicated), from the T_{SRC} ADC module clock source, selected by the CLKSEL[1:0] bits. Then, each ADC core individually divides the $T_{CORESRC}$ clock to get a core-specific T_{ADCORE} clock using the ADCS[6:0] bits in the ADCOREXH register or the SHRADCS[6:0] bits in the ADCON2L register.

Bit 7 – CMPEN Comparator Enable bit

Value	Description
1	Comparator is enabled
0	Comparator is disabled and the STAT status bit is cleared

Bit 6 – IE Comparator Common ADC Interrupt Enable bit

Value	Description
1	Common ADC interrupt will be generated if the comparator detects a comparison event instead of digital comparator interrupt
0	ADC interrupt will not be generated for the comparator

Bit 5 – STAT Comparator Event Status bit

This bit is cleared by hardware when the channel number is read from the CHNL[4:0] bits.

Value	Description
1	A comparison event has been detected since the last read of the CHNL[4:0] bits
0	A comparison event has not been detected since the last read of the CHNL[4:0] bits

Bit 4 – BTWN Between Low/High Comparator Event bit

Value	Description
1	Generates a comparator event when ADCMPxLO ≤ ADCBUFx < ADCMPxHI
0	Does not generate a digital comparator event when ADCMPxLO ≤ ADCBUFx < ADCMPxHI

Bit 3 – HIHI High/High Comparator Event bit

Value	Description
1	Generates a digital comparator event when ADCBUFx ≥ ADCMPxHI
0	Does not generate a digital comparator event when ADCBUFx ≥ ADCMPxHI

Bit 2 – HILO High/Low Comparator Event bit

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
1	Generates a digital comparator event when ADCBUFx < ADCMPxHI
0	Does not generate a digital comparator event when ADCBUFx < ADCMPxHI

Bit 1 – LOHI Low/High Comparator Event bit

Value	Description
1	Generates a digital comparator event when ADCBUFx ≥ ADCMPxLO
0	Does not generate a digital comparator event when ADCBUFx ≥ ADCMPxLO

Bit 0 – LOLO Low/Low Comparator Event bit

Value	Description
1	Generates a digital comparator event when ADCBUFx < ADCMPxLO
0	Does not generate a digital comparator event when ADCBUFx < ADCMPxLO

10	10-bit resolution
01	8-bit resolution(1)
00	6-bit resolution(1)

Bits 6:0 – ADCS[6:0] ADC Core x Input Clock Divider bits

These bits determine the number of Source Clock Periods ($T_{CORESRC}$) for one Core Clock Period (T_{ADCORE}).

Value	Description
1111111	254 Source Clock Periods
. . .	
0000011	6 Source Clock Periods

14. High-Speed Analog Comparator with Slope Compensation DAC

Notes:

1. This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"High-Speed Analog Comparator with Slope Compensation DAC"** (www.microchip.com/DS70005280).
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

The high-speed analog comparator module provides a method to monitor voltage, current and other critical signals in a power conversion application that may be too fast for the CPU and ADC to capture. The analog comparator module can be used to implement Peak Current mode control, Critical Conduction mode (variable frequency) and Hysteretic Control mode.

14.1 Overview

The high-speed analog comparator module is comprised of a high-speed comparator, Pulse Density Modulation (PDM) DAC and a slope compensation unit. The slope compensation unit provides a user-defined slope which can be used to alter the DAC output. This feature is useful in applications, such as Peak Current mode control, where slope compensation is required to maintain the stability of the power supply. The user simply specifies the direction and rate of change for the slope compensation, and the output of the DAC is modified accordingly.

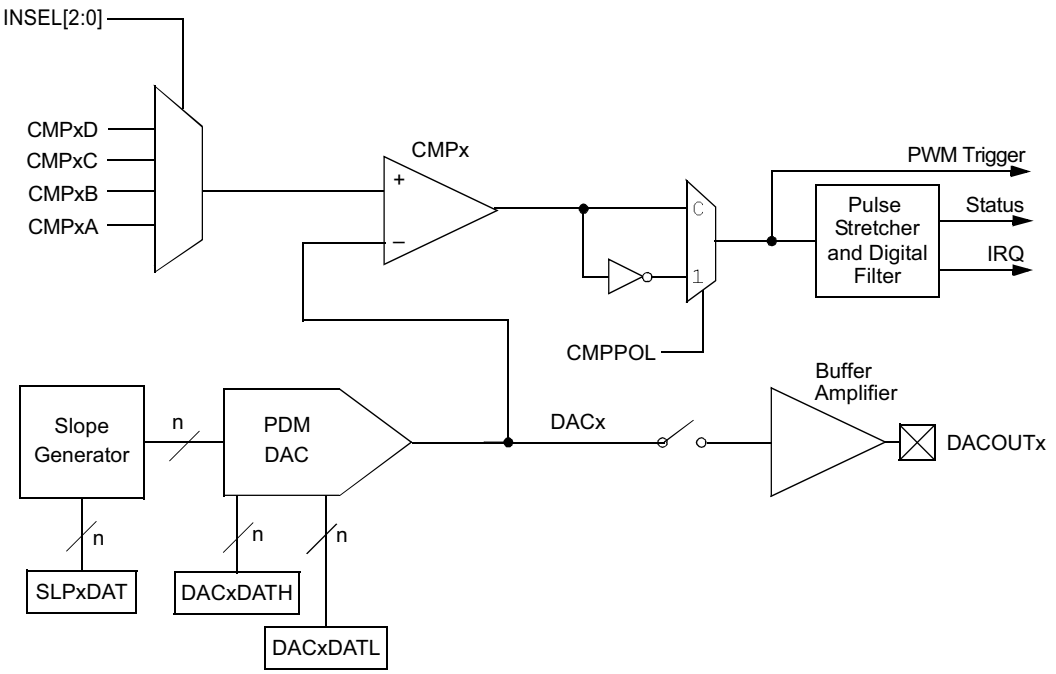

The DAC consists of a PDM unit, followed by a digitally controlled multiphase RC filter. The PDM unit uses a phase accumulator circuit to generate an output stream of pulses. The density of the pulse stream is proportional to the input data value, relative to the maximum value supported by the bit width of the accumulator. The output pulse density is representative of the desired output voltage. The pulse stream is filtered with an RC filter to yield an analog voltage. The output of the DAC is connected to the negative input of the comparator. The positive input of the comparator can be selected using a MUX from the input pins. The comparator provides a high-speed operation with a typical delay of 15 ns.

The output of the comparator is processed by the pulse stretcher and the digital filter blocks, which prevent comparator response to unintended fast transients in the inputs. Figure 14-1 shows a block diagram of the high-speed analog comparator module. The DAC module can be operated in one of three modes: Slope Generation mode, Hysteretic mode and Triangle Wave mode. Each of these modes can be used in a variety of power supply applications.

Note: This device supports two DACOUT pins, DACOUT1 and DACOUT2. DAC instances, DAC1, DAC2 and DAC3, are associated with DACOUT1. DAC instances, DAC4, DAC5 and DAC6, are associated with DACOUT2. The DACOUTx pin can only be associated with a single DAC output at any given time. If more than one DACOEN bit is set, the DACOUTx pin will be a combination of the signals.

14.2 Features Overview

- Six Rail-to-Rail Analog Comparators
- Up to Four Selectable Input Sources per Comparator:
  - Four external inputs
- Programmable Comparator Hysteresis
- Programmable Output Polarity
- Interrupt Generation Capability
- Dedicated Pulse Density Modulation DAC for each Analog Comparator:
  - PDM unit followed by a digitally controlled multimode multipole RC filter
- Multimode Multipole RC Output Filter:
  - Transition mode: Provides the fastest response
  - Fast mode: For tracking DAC slopes
  - Steady-State mode: Provides 12-bit resolution
- Slope Compensation along with each DAC:
  - Slope Generation mode
  - Hysteretic Control mode
  - Triangle Wave mode
- Functional Support for the High-Speed PWM module which Includes:
  - PWM duty cycle control
  - PWM period control

14.3 DAC Control Registers

The DACCTRL1L and DACCTRL2H/L registers are common configuration registers for DAC modules. The DACxCON, DACxDAT, SLPxCON and SLPxDAT registers specify the operation of individual modules.

15. Quadrature Encoder Interface (QEI)

Notes:

1. This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive resource. For more information, refer to the **"Quadrature Encoder Interface (QEI)"** (www.microchip.com/DS70000601).
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

The Quadrature Encoder Interface (QEI) module provides the interface to incremental encoders for obtaining mechanical position data. Quadrature Encoders, also known as incremental encoders or optical encoders, detect position and speed of rotating motion systems. Quadrature Encoders enable closed-loop control of motor control applications, such as Switched Reluctance (SR) and AC Induction Motors (ACIM).

A typical Quadrature Encoder includes a slotted wheel attached to the shaft of the motor and an emitter/detector module that senses the slots in the wheel. Typically, three output channels, Phase A (QEAx), Phase B (QEBx) and Index (INDXx), provide information on the movement of the motor shaft, including distance and direction.

The two channels, Phase A (QEAx) and Phase B (QEBx), are typically 90 degrees out of phase with respect to each other. The Phase A and Phase B channels have a unique relationship. If Phase A leads Phase B, the direction of the motor is deemed positive or forward. If Phase A lags Phase B, the direction of the motor is deemed negative or reverse. The Index pulse occurs once per mechanical revolution and is used as a reference to indicate an absolute position. Figure 15-1 illustrates the Quadrature Encoder Interface signals.

The Quadrature signals from the encoder can have four unique states ('01', '00', '10' and '11') that reflect the relationship between QEAx and QEBx. Figure 15-1 illustrates these states for one count cycle. The order of the states get reversed when the direction of travel changes.

The Quadrature Decoder increments or decrements the 32-bit up/down Position x Counter (POSxCNTH/L) registers for each Change-of-State (COS). The counter increments when QEAx leads QEBx and decrements when QEBx leads QEAx. Table 15-1 shows an overview of the QEI module.

Figure 15-1. Quadrature Encoder Interface Signals

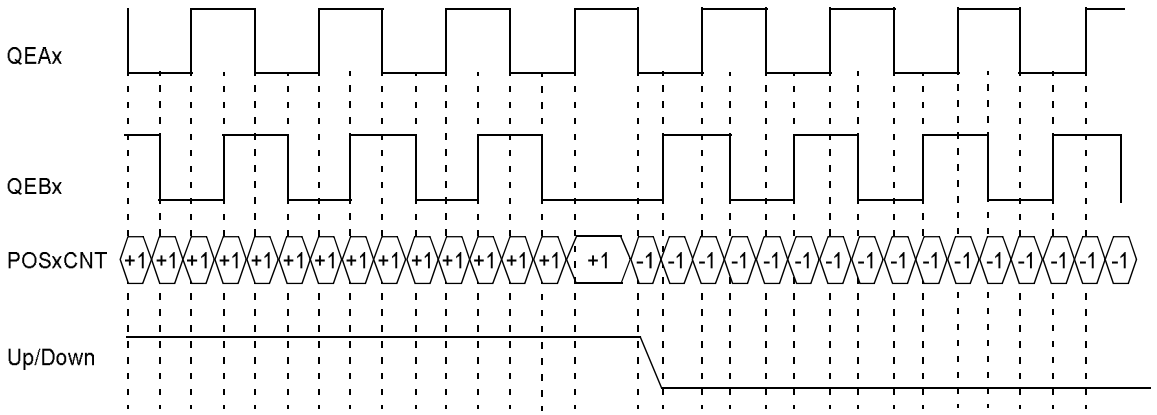

Table 15-1 shows the truth table that describes how the Quadrature signals are decoded.

Table 15-1. Truth Table for Quadrature Encoder

0	0	1	1	Invalid state change; ignore
0	0	1	0	Count down
0	0	0	1	Count up
0	0	0	0	No count or direction change

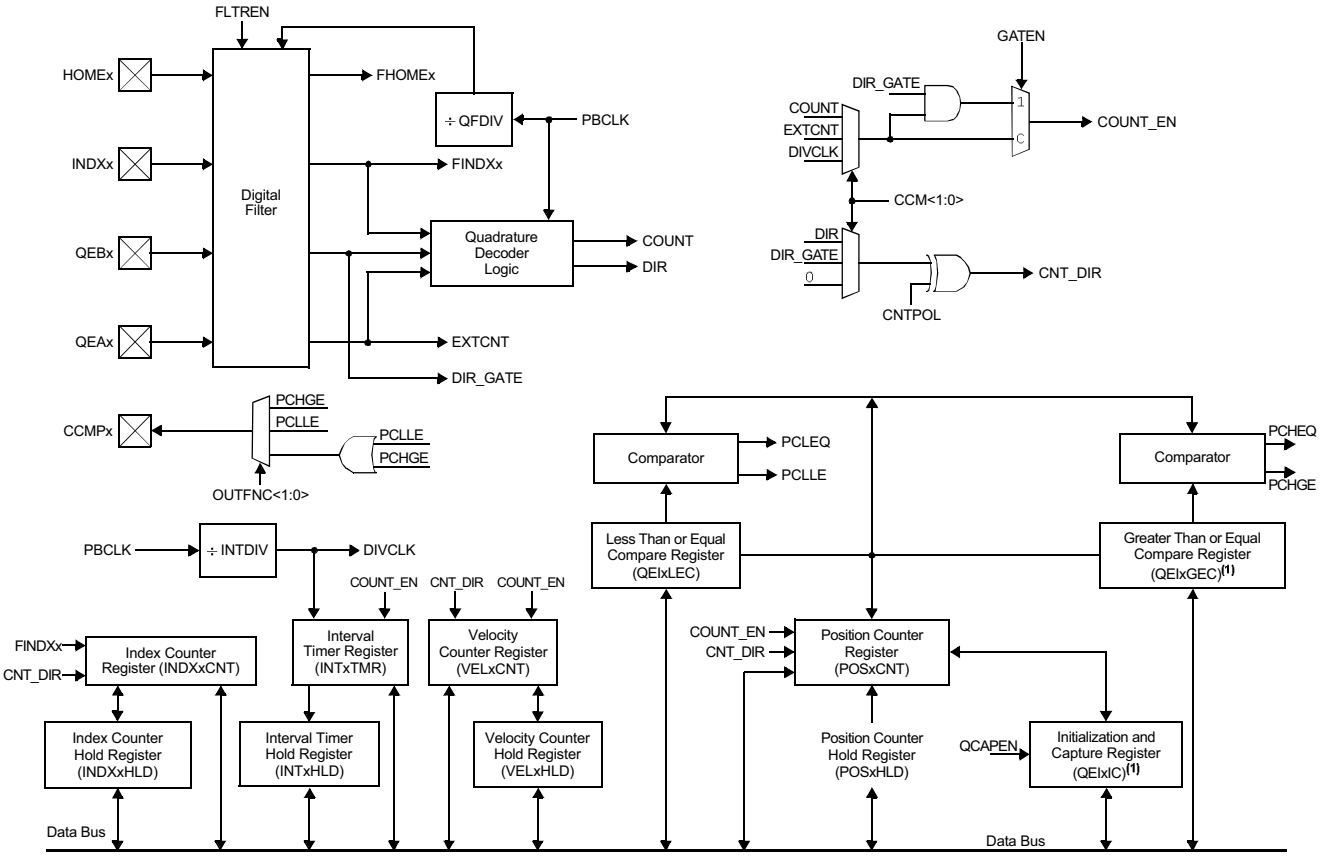

Figure 15-2 illustrates the simplified block diagram of the QEI module. The QEI module consists of decoder logic to interpret the Phase A (QEAx) and Phase B (QEBx) signals, and an up/down counter to accumulate the count. The counter pulses are generated when the Quadrature state changes. The count direction information must be maintained in a register until a direction change is detected. The module also includes digital noise filters, which condition the input signal.

The QEI module consists of the following major features:

- Four Input Pins: Two Phase Signals, an Index Pulse and a Home Pulse
- Programmable Digital Noise Filters on Inputs
- Quadrature Decoder providing Counter Pulses and Count Direction
- Count Direction Status
- 4x Count Resolution
- Index (INDXx) Pulse to Reset the Position Counter
- General Purpose 32-Bit Timer/Counter mode
- Interrupts generated by QEI or Counter Events
- 32-Bit Velocity Counter
- 32-Bit Position Counter
- 32-Bit Index Pulse Counter
- 32-Bit Interval Timer
- 32-Bit Position Initialization/Capture Register
- 32-Bit Compare Less Than and Greater Than Registers
- External Up/Down Count mode
- External Gated Count mode
- External Gated Timer mode
- Interval Timer mode

15.1.1 QEIx Control Register

Name: QEIxCON
Offset: 0x140, 0x174, 0xEC4

Notes:

1. When CCMx = 10 or CCMx = 11, all of the QEI counters operate as timers and the PIMOD[2:0] bits are ignored.
2. When CCMx = 00, and QEAx and QEBx values match the Index Match Value (IMV), the POSxCNTH and POSxCNTL registers are reset.
3. The selected clock rate should be at least twice the expected maximum quadrature count rate.
4. Not all devices support this mode.
5. The QCAPEN and HCAPEN bits must be cleared during PIMODx Modes 2 through 7 to ensure proper functionality. Not all devices support HCAPEN.

Bit 15 – QEIEN Quadrature Encoder Interface Module Enable bit

Value	Description
1	Module counters are enabled
0	Module counters are disabled, but SFRs can be read or written

Bit 13 – QEISIDL QEI Stop in Idle Mode bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bits 12:10 – PIMOD[2:0] Position Counter Initialization Mode Select bits(1,5)

Value	Description
111	Modulo Count mode for position counter and every Index event resets the position counter(4)
110	Modulo Count mode for position counter
101	Resets the position counter when the position counter equals the QEIxGEC register
100	Second Index event after Home event initializes the position counter with the contents of the QEIxIC register
011	First Index event after Home event initializes the position counter with the contents of the QEIxIC register
010	Next Index input event initializes the position counter with the contents of the QEIxIC register
001	Every Index input event resets the position counter
000	Index input event does not affect the position counter

Bits 9:8 – IMV[1:0] Index Match Value bits(2)

Value	Description
11	Index match occurs when QEBx = 1 and QEAx = 1
10	Index match occurs when QEBx = 1 and QEAx = 0
01	Index match occurs when QEBx = 0 and QEAx = 1
00	Index match occurs when QEBx = 0 and QEAx = 0

Bits 6:4 – INTDIV[2:0] Timer Input Clock Prescale Select bits(3) (interval timer, main timer (position counter), velocity counter and Index counter internal clock divider select)

Value	Description
111	1:256 prescale value
110	1:64 prescale value
101	1:32 prescale value
100	1:16 prescale value
011	1:8 prescale value
010	1:4 prescale value
001	1:2 prescale value
000	1:1 prescale value

Bit 3 – CNTPOL Position and Index Counter/Timer Direction Select bit

Value	Description
1	Counter direction is negative unless modified by an external up/down signal
0	Counter direction is positive unless modified by an external up/down signal

Bit 2 – GATEN External Count Gate Enable bit

Value	Description
1	External gate signal controls position counter operation
0	External gate signal does not affect position counter operation

Bits 1:0 – CCM[1:0] Counter Control Mode Selection bits

Value	Description
11	Internal Timer mode
10	External Clock Count with External Gate mode
01	External Clock Count with External Up/Down mode
00	Quadrature Encoder mode

16. Universal Asynchronous Receiver Transmitter (UART)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Multiprotocol Universal Asynchronous Receiver Transmitter (UART) Module"** (www.microchip.com/DS70005288).

The Universal Asynchronous Receiver Transmitter (UART) is a flexible serial communication peripheral used to interface dsPIC® microcontrollers with other equipment, including computers and peripherals. The UART is a full-duplex, asynchronous communication channel that can be used to implement protocols, such as RS-232 and RS-485. The UART also supports the following hardware extensions:

- LIN/J2602
- Digital Multiplex (DMX)
- Smart Card

The primary features of the UART are:

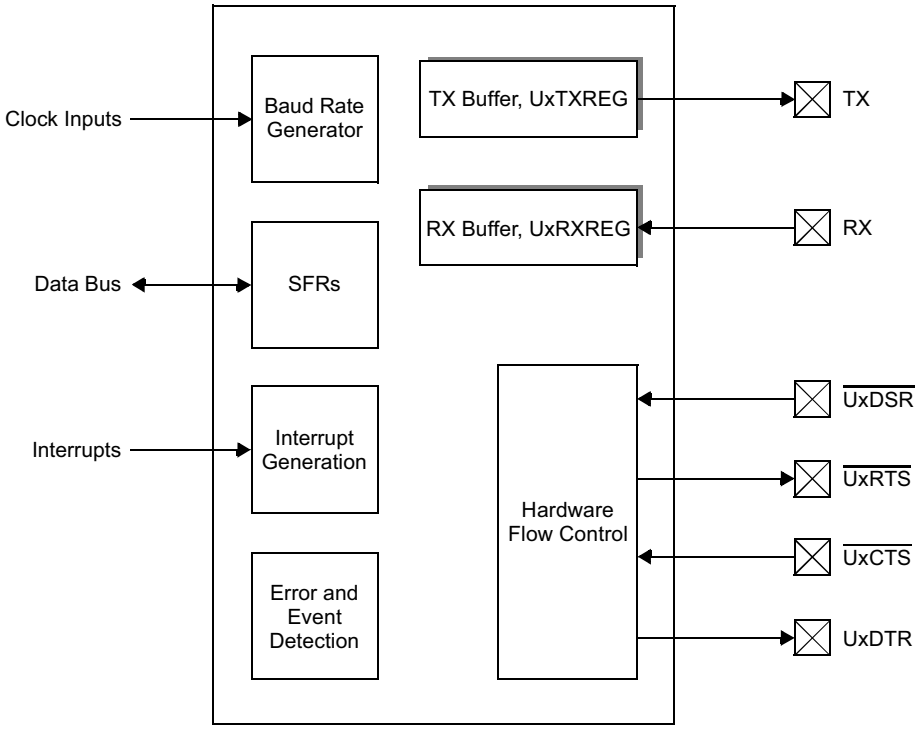

- Full or Half-Duplex Operation
- Up to 8-Deep TX and RX First-In First-Out (FIFO) Buffers
- 8-Bit or 9-Bit Data Width
- Configurable Stop Bit Length
- Flow Control
- Auto-Baud Calibration
- Parity, Framing and Buffer Overrun Error Detection
- Address Detect
- Break Transmission
- Transmit and Receive Polarity Control
- Manchester Encoder/Decoder
- Operation in Sleep mode
- Wake from Sleep on Sync Break Received Interrupt

16.1 Architectural Overview

The UART transfers bytes of data, to and from device pins, using First-In First-Out (FIFO) buffers up to eight bytes deep. The status of the buffers and data is made available to user software through Special Function Registers (SFRs). The UART implements multiple interrupt channels for handling transmit, receive and error events. A simplified block diagram of the UART is shown in Figure 16-1.

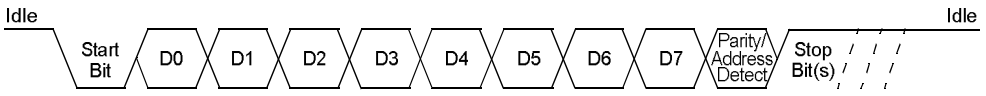

Figure 16-1. Simplified UARTx Block Diagram

16.2 Character Frame

A typical UART character frame is shown in Figure 16-2. The Idle state is high with a 'Start' condition indicated by a falling edge. The Start bit is followed by a number of data, parity/address detect and Stop bits defined by the MOD[3:0] (UxMODE[3:0]) bits selected.

Figure 16-2. UART Character Frame

16.3 Data Buffers

Both transmit and receive functions use buffers to store data shifted to/from the pins. These buffers are FIFOs and are accessed by reading the SFRs, UxTXREG and UxRXREG, respectively. Each data buffer has multiple flags associated with its operation to allow software to read the status. Interrupts can also be configured based on the space available in the buffers. The transmit and receive buffers can be cleared and their pointers reset using the associated TX/RX Buffer Empty Status bits, UTXBE (UxSTAH[5]) and URXBE (UxSTAH[1]).

16.4 Protocol Extensions

The UART provides hardware support for LIN/J2602, DMX and smart card protocol extensions to reduce software overhead. A protocol extension is enabled by writing a value to the MOD[3:0] (UxMODE[3:0]) selection bits and further configured using the UARTx Timing Parameter registers, UxP1, UxP2, UxP3 and UxP3H. Details regarding operation and usage are discussed in their respective chapters. Not all protocols are available on all devices.

Bit 15 – UARTEN UART Enable bit

Value	Description
1	UART is ready to transmit and receive
0	UART state machine, FIFO Buffer Pointers and counters are reset; registers are readable and writable

Bit 13 – USIDL UART Stop in Idle Mode bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bit 12 – WAKE Wake-up Enable bit

Value	Description
1	Module will continue to sample the RX pin – interrupt generated on falling edge, bit cleared in hardware on following rising edge; if ABAUD is set, Auto-Baud Detection (ABD) will begin immediately
0	RX pin is not monitored nor rising edge detected

Bit 11 – RXBIMD Receive Break Interrupt Mode bit

Value	Description
1	RXBKIF flag when a minimum of 23 (DMX)/11 (asynchronous or LIN/J2602) low bit periods are detected
0	RXBKIF flag when the Break makes a low-to-high transition after being low for at least 23/11-bit periods

Bit 9 – BRKOVR Send Break Software Override bit

Overrides the TX Data Line:

Value	Description
1	Makes the TX line active (Output 0 when UTXINV = 0, Output 1 when UTXINV = 1)
0	TX line is driven by the shifter

Bit 8 – UTXBRK UART Transmit Break bit(1)

Value	Description
1	Sends Sync Break on next transmission; cleared by hardware upon completion
0	Sync Break transmission is disabled or has completed

Bit 7 – BRGH High Baud Rate Select bit

Value	Description
1	High Speed: Baud rate is baudclk/4
0	Low Speed: Baud rate is baudclk/16

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Bit 6 – ABAUD Auto-Baud Detect Enable bit (read-only when MOD[3:0] = 1xxx)

Value	Description
1	Enables baud rate measurement on the next character – requires reception of a Sync field (55h); cleared in hardware upon completion
0	Baud rate measurement is disabled or has completed

Bit 5 – UTXEN UART Transmit Enable bit

Value	Description
1	Transmit enabled – except during Auto-Baud Detection
0	Transmit disabled – all transmit counters, pointers and state machines are reset; TX buffer is not flushed, status bits are not reset

Bit 4 – URXEN UART Receive Enable bit

Value	Description
1	Receive enabled – except during Auto-Baud Detection
0	Receive disabled – all receive counters, pointers and state machines are reset; RX buffer is not flushed, status bits are not reset

Value	Description
1	UART BRG clock runs during Sleep
0	UART BRG clock is turned off during Sleep

Bit 14 – ACTIVE UART Running Status bit

Value	Description
1	UART clock request is active (user can not update the UxMODE/UxMODEH registers)
0	UART clock request is not active (user can update the UxMODE/UxMODEH registers)

Bit 11 – BCLKMOD Baud Clock Generation Mode Select bit

Value	Description
1	Uses fractional Baud Rate Generation
0	Uses legacy divide-by-x counter for baud clock generation (x = 4 or 16 depending on the BRGH bit)

Bits 10:9 – BCLKSEL[1:0] Baud Clock Source Selection bits

Value	Description
11	$AF_{VCO}/3$
10	F_{OSC}
01	Reserved
00	$F_{OSC}/2$ (F_P)

Bit 8 – HALFDPLX UART Half-Duplex Selection Mode bit

Value	Description
1	Half-Duplex mode: UxTX is driven as an output when transmitting and tri-stated when TX is Idle
0	Full-Duplex mode: UxTX is driven as an output at all times when both UARTEN and UTXEN are set

Bit 7 – RUNOVF Run During Overflow Condition Mode bit

Value	Description
1	When an Overflow Error (OERR) condition is detected, the RX shifter continues to run so as to remain synchronized with incoming RX data; data are not transferred to UxRXREG when it is full (i.e., no UxRXREG data are overwritten)
0	When an Overflow Error (OERR) condition is detected, the RX shifter stops accepting new data (Legacy mode)

Bit 6 – URXINV UART Receive Polarity bit

Value	Description
1	Inverts RX polarity; Idle state is low
0	Input is not inverted; Idle state is high

Bits 5:4 – STSEL[1:0] Number of Stop Bits Selection bits

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
11	2 Stop bits sent, 1 checked at receive
10	2 Stop bits sent, 2 checked at receive
01	1.5 Stop bits sent, 1.5 checked at receive
00	1 Stop bit sent, 1 checked at receive

Bit 3 – C0EN Enable Legacy Checksum (C0) Transmit and Receive bit

Value	Description
1	Checksum Mode 1 (enhanced LIN checksum in LIN mode; add all TX/RX words in all other modes)
0	Checksum Mode 0 (legacy LIN checksum in LIN mode; not used in all other modes)

Bit 2 – UTXINV UART Transmit Polarity bit

Value	Description
1	Inverts TX polarity; TX is low in Idle state
0	Output data are not inverted; TX output is high in Idle state

Bits 1:0 – FLO[1:0] Flow Control Enable bits (only valid when MOD[3:0] = 0xxx)

Value	Description
11	Reserved
10	$\overline{\text{RTS}}$-$\overline{\text{DSR}}$ (for TX side)/$\overline{\text{CTS}}$-DTR (for RX side) hardware flow control
01	XON/XOFF software flow control
00	Flow control off

Bits 14:12 – UTXISEL[2:0] UART Transmit Interrupt Select bits

Value	Description
111	Sets transmit interrupt when there is one empty slot left in the buffer
. . .	
010	Sets transmit interrupt when there are six empty slots or more in the buffer
001	Sets transmit interrupt when there are seven empty slots or more in the buffer
000	Sets transmit interrupt when there are eight empty slots in the buffer; TX buffer is empty

Bits 10:8 – URXISEL[2:0] UART Receive Interrupt Select bits(1)

Value	Description
111	Triggers receive interrupt when there are eight words in the buffer; RX buffer is full
. . .	
001	Triggers receive interrupt when there are two words or more in the buffer
000	Triggers receive interrupt when there is one word or more in the buffer

Bit 7 – TXWRE TX Write Transmit Error Status bit

LIN and Parity Modes:
1 = A new byte was written when buffer was full or when P2[8:0] = 0 (must be cleared by software)
0 = No error
Address Detect Mode:
1 = A new byte was written when buffer was full or to P1[8:0] when P1x was full (must be cleared by software)
0 = No error
Other Modes:
1 = A new byte was written when buffer was full (must be cleared by software)
0 = No error

Bit 6 – STPMD Stop Bit Detection Mode bit

Value	Description
1	Triggers RXIF at the end of the last Stop bit
0	Triggers RXIF in the middle of the first (or second, depending on the STSEL[1:0] setting) Stop bit

Bit 5 – UTXBE UART TX Buffer Empty Status bit

Value	Description
1	Transmit buffer is empty; writing '1' when UTXEN = 0 will reset the TX FIFO Pointers and counters
0	Transmit buffer is not empty

0	Transmit buffer is not full

Bit 3 – RIDLE Receive Idle bit

Value	Description
1	UART RX line is in the Idle state
0	UART RX line is receiving something

Bit 2 – XON UART in XON Mode bit

Only valid when FLO[1:0] control bits are set to XON/XOFF mode.

Value	Description
1	UART has received XON
0	UART has not received XON or XOFF was received

Bit 1 – URXBE UART RX Buffer Empty Status bit

Value	Description
1	Receive buffer is empty; writing '1' when URXEN = 0 will reset the RX FIFO Pointers and counters
0	Receive buffer is not empty

Bit 0 – URXBF UART RX Buffer Full Status bit

Value	Description
1	Receive buffer is full
0	Receive buffer is not full

17. Serial Peripheral Interface (SPI)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Serial Peripheral Interface (SPI) with Audio Codec Support"** (www.microchip.com/DS70005136) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface, useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, shift registers, display drivers, A/D Converters, etc. The SPI module is compatible with the Motorola® SPI and SIOP interfaces. All devices in the dsPIC33CK1024MP710 family include three SPI modules.

The module supports operation in two Buffer modes. In Standard mode, data are shifted through a single serial buffer. In Enhanced Buffer mode, data are shifted through a FIFO buffer. The FIFO level depends on the configured mode.

Note: FIFO depth for this device is four (in 8-Bit Data mode).

Variable length data can be transmitted and received, from 2 to 32 bits.

Note: Do not perform Read-Modify-Write operations (such as bit-oriented instructions) on the SPIxBUF register in either Standard or Enhanced Buffer mode.

The module also supports Audio modes. Four different Audio modes are available.

- I^2S mode
- Left Justified mode
- Right Justified mode
- PCM/DSP mode

In each of these modes, the serial clock is free-running and audio data are always transferred.

The SPI serial interface consists of four pins:

- SDIx: Serial Data Input
- SDOx: Serial Data Output
- SCKx: Shift Clock Input or Output

The SPI module can be configured to operate using two, three or four pins.

The SPI module has the ability to generate three interrupts, reflecting the events that occur during the data communication. The following types of interrupts can be generated:

1. Receive interrupts are signaled by SPIxRXIF. This event occurs when:
   - RX watermark interrupt
   - SPIROV = 1
   - SPIRBF = 1
   - SPIRBE = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.
2. Transmit interrupts are signalled by SPIxTXIF. This event occurs when:
   - TX watermark interrupt
   - SPITUR = 1
   - SPITBF = 1
   - SPITBE = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

3. General interrupts are signalled by SPIxGIF. This event occurs when:
   - FRMERR = 1
   - SPIBUSY = 1
   - SRMT = 1

   provided the respective mask bits are enabled in SPIxIMSKL/H.

Block diagrams of the module in Standard and Enhanced modes are shown in Figure 17-1 and Figure 17-2.

Note: In this section, the SPI modules are referred to together as SPIx, or separately as SPI1, SPI2 or SPI3. Special Function Registers will follow a similar notation. For example, SPIxCON1 and SPIxCON2 refer to the control registers for any of the three SPI modules.

To set up the SPIx module for the Standard Host mode of operation:

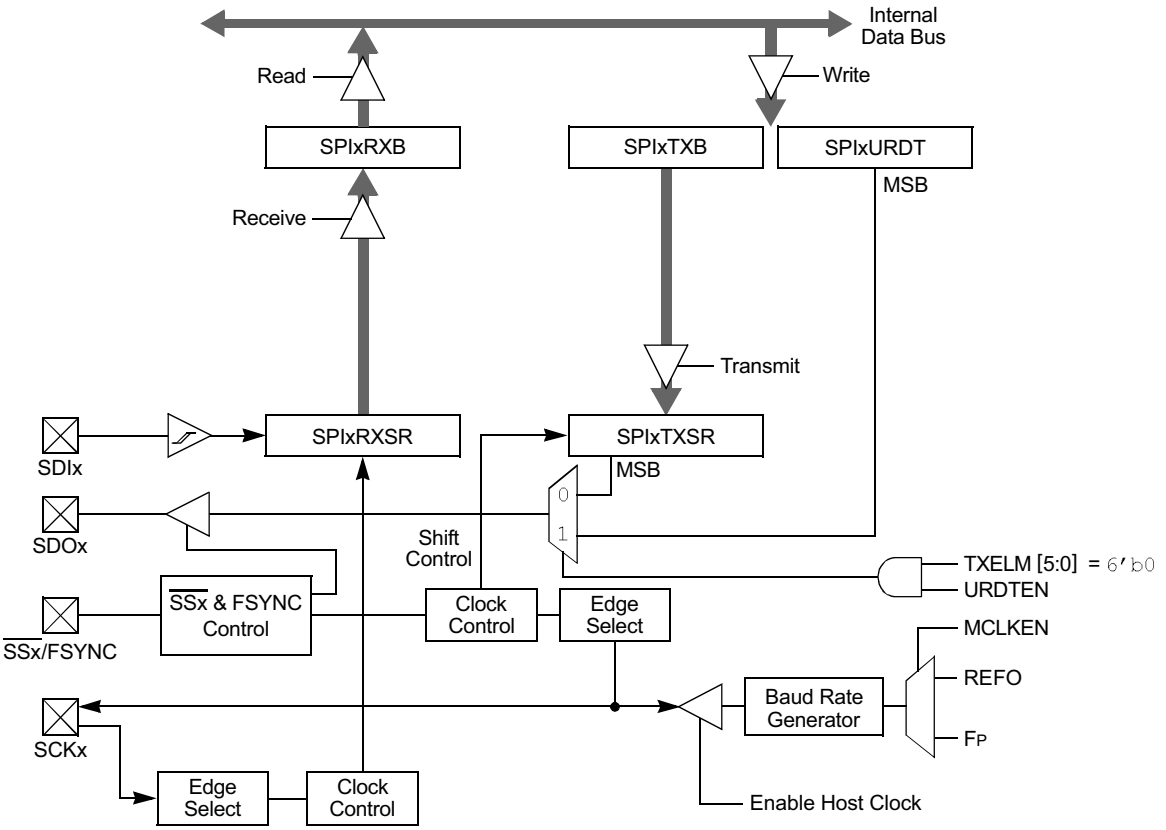

1. If using interrupts:
   a. Clear the interrupt flag bits in the respective IFSx register.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
2. Write the desired settings to the SPIxCON1L and SPIxCON1H registers with the MSTEN bit (SPIxCON1L[5]) = 1.
3. Clear the SPIROV bit (SPIxSTATL[6]).
4. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
5. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

To set up the SPIx module for the Standard Client mode of operation:

1. Clear the SPIxBUF registers.
2. If using interrupts:
   a. Clear the SPIxBUFL and SPIxBUFH registers.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = 0.
4. Clear the SMP bit.
5. If the CKE bit (SPIxCON1L[8]) is set, then the SSEN bit (SPIxCON1L[7]) must be set to enable the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTATL[6]).
7. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

Figure 17-1. SPIx Module Block Diagram (Standard Mode)

To set up the SPIx module for the Enhanced Buffer Host mode of operation:

1. If using interrupts:
   a. Clear the interrupt flag bits in the respective IFSx register.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register.
2. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with MSTEN (SPIxCON1L[5]) = 1.
3. Clear the SPIROV bit (SPIxSTATL[6]).
4. Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
5. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).
6. Write the data to be transmitted to the SPIxBUFL and SPIxBUFH registers. Transmission (and reception) will start as soon as data are written to the SPIxBUFL and SPIxBUFH registers.

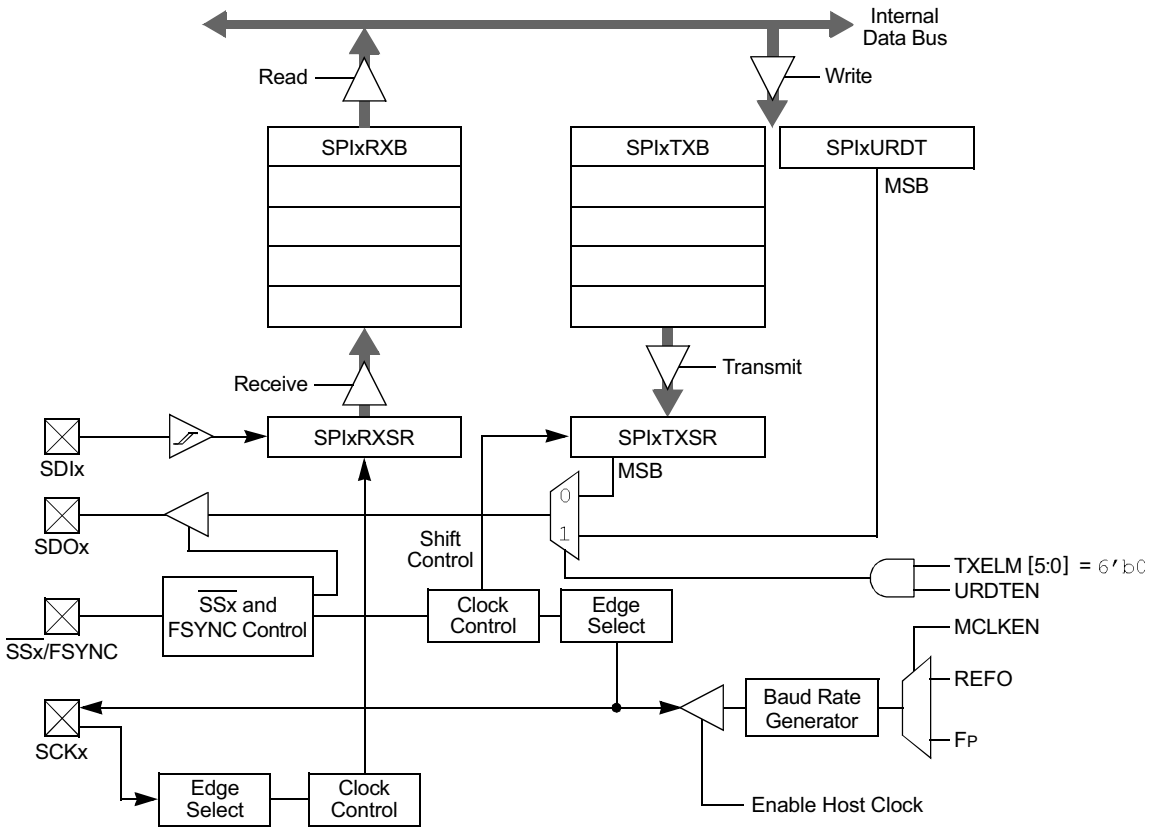

To set up the SPIx module for the Enhanced Buffer Client mode of operation:

1. Clear the SPIxBUFL and SPIxBUFH registers.
2. If using interrupts:
   a. Clear the interrupt flag bits in the respective IFSx register.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.

3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with the MSTEN bit (SPIxCON1L[5]) = 0.
4. Clear the SMP bit.
5. If the CKE bit is set, then the SSEN bit must be set, thus enabling the $\overline{SSx}$ pin.
6. Clear the SPIROV bit (SPIxSTATL[6]).
7. Select Enhanced Buffer mode by setting the ENHBUF bit (SPIxCON1L[0]).
8. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

Figure 17-2. SPIx Module Block Diagram (Enhanced Mode)

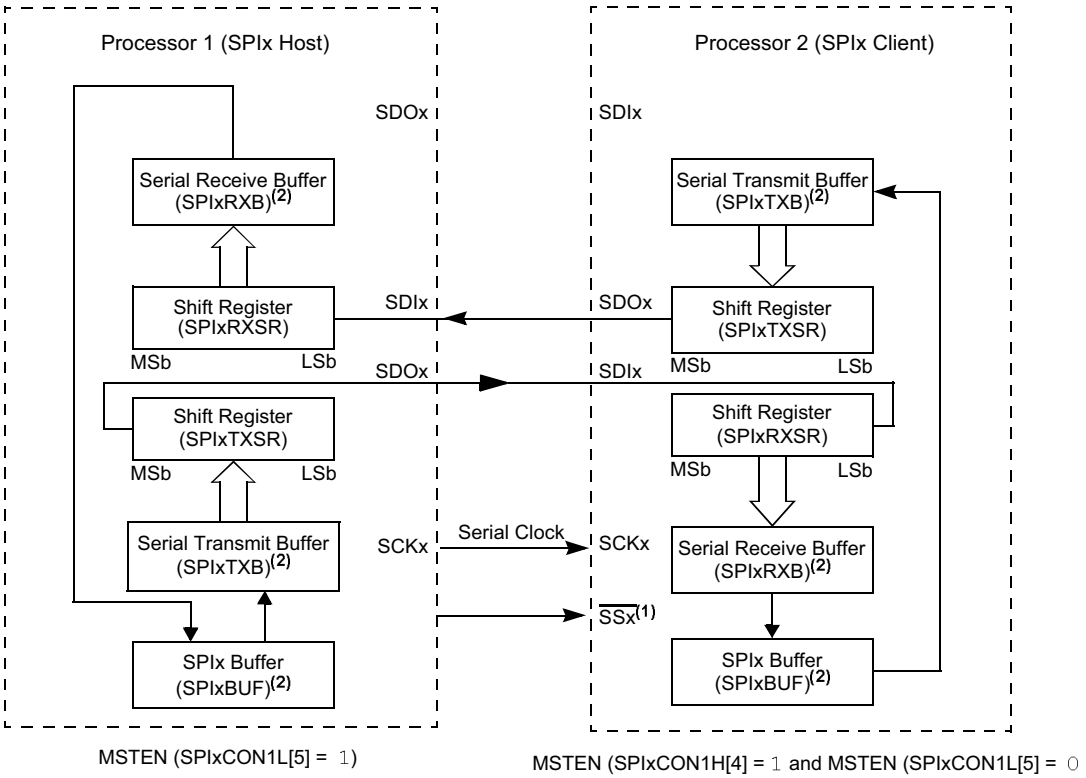

To set up the SPIx module for Audio mode:

1. Clear the SPIxBUFL and SPIxBUFH registers.
2. If using interrupts:
   a. Clear the interrupt flag bits in the respective IFSx register.
   b. Set the interrupt enable bits in the respective IECx register.
   c. Write the SPIxIP bits in the respective IPCx register to set the interrupt priority.
3. Write the desired settings to the SPIxCON1L, SPIxCON1H and SPIxCON2L registers with AUDEN (SPIxCON1H[15]) = 1.
4. Clear the SPIROV bit (SPIxSTATL[6]).
5. Enable SPIx operation by setting the SPIEN bit (SPIxCON1L[15]).

17.1.3 SPIx Control Register 1 Low

Name: SPIxCON1L
Offset: 0x560, 0x4E4, 0x2E4

Notes:

1. When AUDEN = 1, this module functions as if CKE = 0, regardless of its actual value.
2. When FRMEN = 1, SSEN is not used.
3. MCLKEN can only be written when the SPIEN bit = 0.
4. This channel is not meaningful for DSP/PCM mode as LRC follows FRMSYPW.

Bit 15 – SPIEN SPIx On bit

Value	Description
1	Enables module
0	Turns off and resets module, disables clocks, disables interrupt event generation, allows SFR modifications

Bit 13 – SPISIDL SPIx Stop in Idle Mode bit

Value	Description
1	Halts in CPU Idle mode
0	Continues to operate in CPU Idle mode

Bit 12 – DISSDO Disable SDOx Output Port bit

Value	Description
1	SDOx pin is not used by the module; pin is controlled by port function
0	SDOx pin is controlled by the module

Bits 11:10 – MODE32 and MODE16[1:0] Serial Word Length Select bits(1,4)

MODE32	MODE16	AUDEN	Communication
1	x	0	32-Bit
0	1		16-Bit
0	0		8-Bit
1	1	1	24-Bit Data, 32-Bit FIFO, 32-Bit Channel/64-Bit Frame
1	0		32-Bit Data, 32-Bit FIFO, 32-Bit Channel/64-Bit Frame
0	1		16-Bit Data, 16-Bit FIFO, 32-Bit Channel/64-Bit Frame
0	0		16-Bit FIFO, 16-Bit Channel/32-Bit Frame

Bit 9 – SMP SPIx Data Input Sample Phase bit

Client Mode:

Input data are always sampled at the middle of data output time, regardless of the SMP setting.

Host Mode:

Value	Description
1	Input data are sampled at the end of data output time
0	Input data are sampled at the middle of data output time

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Bit 8 – CKE SPIx Clock Edge Select bit(1)

Value	Description
1	Transmit happens on transition from Active Clock state to Idle Clock state
0	Transmit happens on transition from Idle Clock state to Active Clock state

Bit 7 – SSEN Client Select Enable bit (Client mode)(2)

Value	Description
1	$\overline{SSx}$ pin is used by the macro in Client mode; $\overline{SSx}$ pin is used as the Client select input
0	$\overline{SSx}$ pin is not used by the macro ($\overline{SSx}$ pin will be controlled by the port I/O)

Bit 6 – CKP Clock Polarity Select bit

Value	Description
1	Idle state for clock is a high level; Active state is a low level
0	Idle state for clock is a low level; Active state is a high level

Bit 5 – MSTEN Host Mode Enable bit

Value	Description
1	Host mode
0	Client mode

Bit 4 – DISSDI Disable SDIx Input Port bit

Value	Description
1	SDIx pin is not used by the module; pin is controlled by port function
0	SDIx pin is controlled by the module

Bit 3 – DISSCK Disable SCKx Output Port bit

Value	Description
1	SCKx pin is not used by the module; pin is controlled by port function
0	SCKx pin is controlled by the module

Bit 2 – MCLKEN Host Clock Enable bit(3)

Value	Description
1	REFO is used by the BRG
0	PBCLK is used by the BRG

Bit 1 – SPIFE Frame Sync Pulse Edge Select bit

Value	Description
1	Frame Sync pulse (Idle-to-active edge) coincides with the first bit clock
0	Frame Sync pulse (Idle-to-active edge) precedes the first bit clock

Bit 0 – ENHBUF Enhanced Buffer Enable bit

Value	Description
1	Enhanced Buffer mode is enabled
0	Enhanced Buffer mode is disabled

17.1.4 SPIx Control Register 1 High

Name: SPIxCON1H
Offset: 0x562, 0x4E6, 0x2E6

Notes:

1. AUDEN can only be written when the SPIEN bit = 0.
2. AUDMONO can only be written when the SPIEN bit = 0 and is only valid for AUDEN = 1.
3. URDTEN is only valid when IGNTUR = 1.
4. AUDMOD[1:0] can only be written when the SPIEN bit = 0 and is only valid when AUDEN = 1. When NOT in PCM/DSP mode, this module functions as if FRMSYPW = 1, regardless of its actual value.

Bit	15	14	13	12	11	10	9	8
	AUDEN	SPISGNEXT	IGNROV	IGNTUR	AUDMONO	URDTEN	AUDMOD[1:0]

Reset	0	0	0	0	0	0	0	0

Bit 15 – AUDEN Audio Codec Support Enable bit(1)

Value	Description
1	Audio protocol is enabled; MSTEN controls the direction of both SCKx and frame (a.k.a. LRC), and this module functions as if FRMEN = 1, FRMSYNC = MSTEN, FRMCNT[2:0] = 001 and SMP = 0, regardless of their actual values
0	Audio protocol is disabled

Bit 14 – SPISGNEXT SPIx Sign-Extend RX FIFO Read Data Enable bit

Value	Description
1	Data from RX FIFO are sign-extended
0	Data from RX FIFO are not sign-extended

Bit 13 – IGNROV Ignore Receive Overflow bit

Value	Description
1	A Receive Overflow (ROV) is NOT a critical error; during ROV, data in the FIFO are not overwritten by the receive data
0	A ROV is a critical error that stops SPI operation

Bit 12 – IGNTUR Ignore Transmit Underrun bit

Value	Description
1	A Transmit Underrun (TUR) is NOT a critical error and data indicated by URDTEN are transmitted until the SPIxTXB is not empty
0	A TUR is a critical error that stops SPI operation

Bit 11 – AUDMONO Audio Data Format Transmit bit(2)

Value	Description
1	Audio data are mono (i.e., each data word is transmitted on both left and right channels)
0	Audio data are stereo

Bit 10 – URDTEN Transmit Underrun Data Enable bit(3)

Value	Description
1	Transmits data out of SPIxURDT register during Transmit Underrun conditions
0	Transmits the last received data during Transmit Underrun conditions

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Bits 9:8 – AUDMOD[1:0] Audio Protocol Mode Selection bits(4)

Value	Description
11	PCM/DSP mode
10	Right Justified mode: This module functions as if SPIFE = 1, regardless of its actual value
01	Left Justified mode: This module functions as if SPIFE = 1, regardless of its actual value
00	I^2S mode: This module functions as if SPIFE = 0, regardless of its actual value

Bit 7 – FRMEN Framed SPIx Support bit

Value	Description
1	Framed SPIx support is enabled ($\overline{SSx}$ pin is used as the FSYNC input/output)
0	Framed SPIx support is disabled

Bit 6 – FRMSYNC Frame Sync Pulse Direction Control bit

Value	Description
1	Frame Sync pulse input (Client)
0	Frame Sync pulse output (Host)

Bit 5 – FRMPOL Frame Sync/Client Select Polarity bit

Value	Description
1	Frame Sync pulse/Client select is active-high
0	Frame Sync pulse/Client select is active-low

Bit 4 – MSSEN Host Mode Client Select Enable bit

Value	Description
1	SPIx Client select support is enabled with polarity determined by FRMPOL ($\overline{SSx}$ pin is automatically driven during transmission in Host mode)
0	Client select SPIx support is disabled ($\overline{SSx}$ pin will be controlled by port I/O)

Bit 3 – FRMSYPW Frame Sync Pulse-Width bit

Value	Description
1	Frame Sync pulse is one serial word length wide (as defined by MODE[32,16]/WLENGTH[4:0])
0	Frame Sync pulse is one clock (SCKx) wide

Bits 2:0 – FRMCNT[2:0] Frame Sync Pulse Counter bits

Controls the number of serial words transmitted per Sync pulse.

Value	Description
111	Reserved
110	Reserved
101	Generates a Frame Sync pulse on every 32 serial words
100	Generates a Frame Sync pulse on every 16 serial words
011	Generates a Frame Sync pulse on every 8 serial words
010	Generates a Frame Sync pulse on every 4 serial words
001	Generates a Frame Sync pulse on every 2 serial words (value used by audio protocols)
000	Generates a Frame Sync pulse on each serial word

17.1.5 SPIx Control Register 2 Low

Name: SPIxCON2L
Offset: 0x564, 0x4E8, 0x2E8

Notes:

1. These bits are effective when AUDEN = 0 only.
2. Varying the length by changing these bits does not affect the depth of the TX/RX FIFO.

17.1.6 SPIx Status Register Low

Name: SPIxSTATL
Offset: 0x568, 0x4EC, 0x2EC

Note:

1. SPITUR is cleared when SPIEN = 0. When IGNTUR = 1, SPITUR provides dynamic status of the Transmit Underrun condition, but does not stop RX/TX operation and does not need to be cleared by software.

Legend: C = Clearable bit; HS = Hardware Settable bit; HSC = Hardware Settable/Clearable bit

Bit 12 – FRMERR SPIx Frame Error Status bit

Value	Description
1	Frame error is detected
0	No frame error is detected

Bit 11 – SPIBUSY SPIx Activity Status bit

Value	Description
1	Module is currently busy with some transactions
0	No ongoing transactions (at time of read)

Bit 8 – SPITUR SPIx Transmit Underrun Status bit(1)

Value	Description
1	Transmit buffer has encountered a Transmit Underrun condition
0	Transmit buffer does not have a Transmit Underrun condition

Bit 7 – SRMT Shift Register Empty Status bit

Value	Description
1	No current or pending transactions (i.e., neither SPIxTXB or SPIxTXSR contains data to transmit)
0	Current or pending transactions

Bit 6 – SPIROV SPIx Receive Overflow Status bit

Value	Description
1	A new byte/half-word/word has been completely received when the SPIxRXB was full
0	No overflow

Bit 5 – SPIRBE SPIx RX Buffer Empty Status bit

Standard Buffer Mode:
Automatically set in hardware when SPIxBUF is read from, reading SPIxRXB. Automatically cleared in hardware when SPIx transfers data from SPIxRXSR to SPIxRXB.
Enhanced Buffer Mode:
Indicates RXELM[5:0] = 000000.

Value	Description
1	RX buffer is empty
0	RX buffer is not empty

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Bit 3 – SPITBE SPIx Transmit Buffer Empty Status bit

Standard Buffer Mode:

Automatically set in hardware when SPIx transfers data from SPIxTXB to SPIxTXSR. Automatically cleared in hardware when SPIxBUF is written, loading SPIxTXB.

Enhanced Buffer Mode:

Indicates TXELM[5:0] = 000000.

Value	Description
1	SPIxTXB is empty
0	SPIxTXB is not empty

Bit 1 – SPITBF SPIx Transmit Buffer Full Status bit

Standard Buffer Mode:

Automatically set in hardware when SPIxBUF is written, loading SPIxTXB. Automatically cleared in hardware when SPIx transfers data from SPIxTXB to SPIxTXSR.

Enhanced Buffer Mode:

Indicates TXELM[5:0] = 111111.

Value	Description
1	SPIxTXB is full
0	SPIxTXB not full

Bit 0 – SPIRBF SPIx Receive Buffer Full Status bit

Standard Buffer Mode:

Automatically set in hardware when SPIx transfers data from SPIxRXSR to SPIxRXB. Automatically cleared in hardware when SPIxBUF is read from, reading SPIxRXB.

Enhanced Buffer Mode:

Indicates RXELM[5:0] = 111111.

Value	Description
1	SPIxRXB is full
0	SPIxRXB is not full

Name: SPIxIMSKH
Offset: 0x576, 0x4FA, 0x2FA

Notes:

1. Mask values higher than FIFODEPTH are not valid. The module will not trigger a match for any value in this case.
2. RXMSK2 and TXMSK2 bits are only present when FIFODEPTH = 8 or higher.
3. RXMSK3 and TXMSK3 bits are only present when FIFODEPTH = 16 or higher.
4. RXMSK4 and TXMSK4 bits are only present when FIFODEPTH = 32.

Bits 15:0 – SPIxURDTL[15:0] SPI Underrun Data bits

These bits are only used when URDTEN = 1. This register holds the data to transmit when a Transmit Underrun condition occurs.

When the MODE[32:16] or WLENGTH[4:0] bits select 16 to 9-bit data, the SPIx only uses URDATA[15:0]. When the MODE[32:16] or WLENGTH[4:0] bits select 8 to 2-bit data, the SPIx only uses URDATA[7:0].

18. Inter-Integrated Circuit (I^2C)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Inter-Integrated Circuit (I^2C)"** (www.microchip.com/DS70000195).

The Inter-Integrated Circuit (I^2C) module is a serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, display drivers, A/D Converters, etc.

The I^2C module supports these features:

- 7-Bit and 10-Bit Device Addresses
- General Call Address as Defined in the I^2C Protocol
- Both 100 kHz and 400 kHz Bus Specifications
- Configurable Address Masking
- Multi-Host modes to Prevent Loss of Messages in Arbitration
- Bus Repeater mode, Allowing the Acceptance of All Messages as a Client, regardless of the Address
- Automatic SCL

A block diagram of the module is shown in Figure 18-1.

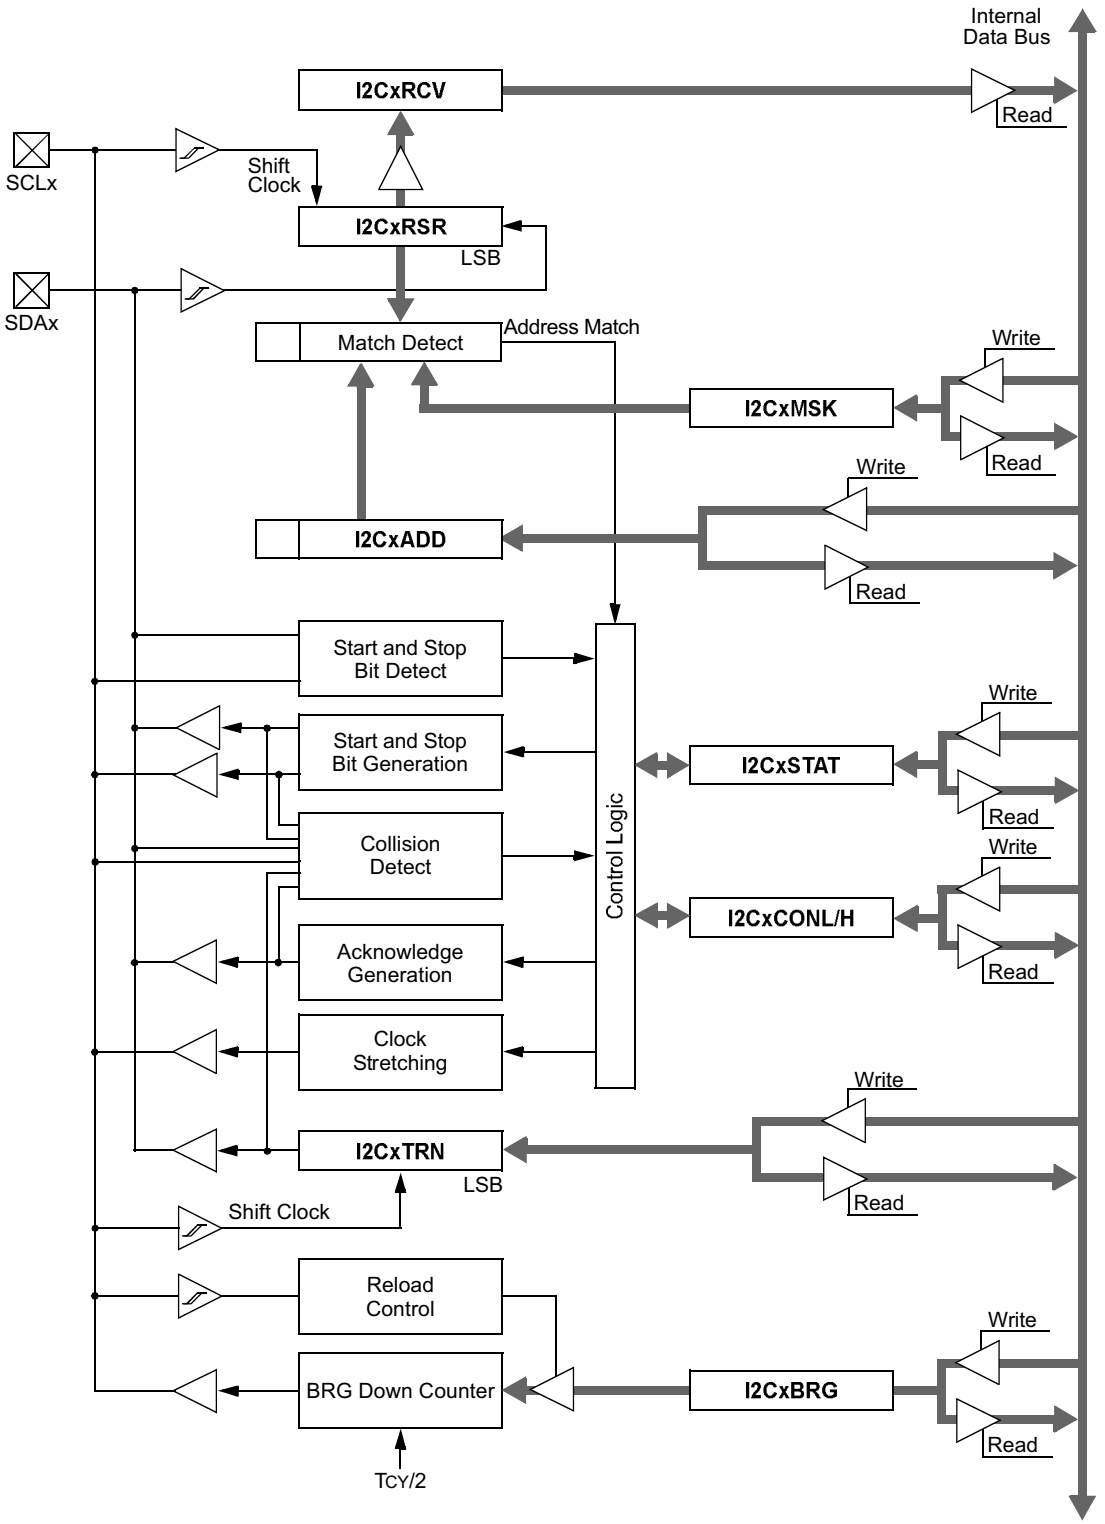

18.1 Communicating as a Host in a Single Host Environment

The details of sending a message in Host mode depends on the communication protocol for the device being communicated with. Typically, the sequence of events is as follows:

1. Assert a Start condition on SDAx and SCLx.
2. Send the I^2C device address byte to the Client with a write indication.
3. Wait for and verify an Acknowledge from the Client.
4. Send the first data byte (sometimes known as the command) to the Client.
5. Wait for and verify an Acknowledge from the Client.
6. Send the serial memory address low byte to the Client.
7. Repeat Steps 4 and 5 until all data bytes are sent.
8. Assert a Repeated Start condition on SDAx and SCLx.
9. Send the device address byte to the Client with a read indication.
10. Wait for and verify an Acknowledge from the Client.
11. Enable Host reception to receive serial memory data.
12. Generate an ACK or NACK condition at the end of a received byte of data.
13. Generate a Stop condition on SDAx and SCLx.

18.2 Setting Baud Rate When Operating as a Bus Main

To compute the Baud Rate Generator reload value, use Equation 18-1.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Equation 18-1. Computing Baud Rate Reload Value(1,2,3)

$$I2CxBRG = ((1/F_{SCL} - Delay) \bullet F_P/2) - 2$$

Notes:

1. These clock rate values are for guidance only. The actual clock rate should be measured in its intended application.
2. Typical value of delay varies from 110 ns to 150 ns.
3. I2CxBRG values of 0 to 3 are expressly forbidden. The user should never program the I2CxBRG with a value of 0x0, 0x1, 0x2 or 0x3 as indeterminate results may occur.

18.3 Client Address Masking

The I2CxMSK register (18.5.5. I2CxMSK) designates address bit positions as "don't care" for both 7-Bit and 10-Bit Addressing modes. Setting a particular bit location (= 1) in the I2CxMSK register causes the Client module to respond, whether the corresponding address bit value is a '0' or a '1'. For example, when I2CxMSK is set to '0010000000', the Client module will detect both addresses, '0000000000' and '0010000000'.

To enable address masking, the Intelligent Peripheral Management Interface (IPMI) must be disabled by clearing the STRICT bit (I2CxCONL[11]).

Note: As a result of changes in the I^2C protocol, the addresses in Table 18-2 are reserved and will not be Acknowledged in Client mode. This includes any address mask settings that include any of these addresses.

Table 18-1. I2Cx Clock Rates(1,2)

F_{CY}	F_{SCL}	I2CxBRG Value	
		Decimal	Hexadecimal
100 MHz	1 MHz	41	29
100 MHz	400 kHz	116	74
100 MHz	100 kHz	491	1EB
80 MHz	1 MHz	32	20
80 MHz	400 kHz	92	5C
80 MHz	100 kHz	392	188
60 MHz	1 MHz	24	18
60 MHz	400 kHz	69	45
60 MHz	100 kHz	294	126
40 MHz	1 MHz	15	0F
40 MHz	400 kHz	45	2D
40 MHz	100 kHz	195	C3
20 MHz	1 MHz	7	7
20 MHz	400 kHz	22	16
20 MHz	100 kHz	97	61

Notes:

1. Based on $F_{CY} = F_{OSC}/2$; Doze mode and PLL are disabled.
2. These clock rate values are for guidance only. The actual clock rate can be affected by various system-level parameters. The actual clock rate should be measured in its intended application.

Table 18-2. I2Cx Reserved Addresses[1]

Client Address	R/W Bit	Description
0000 000	0	General Call Address[2]
0000 000	1	Start Byte
0000 001	x	Cbus Address
0000 01x	x	Reserved
0000 1xx	x	HS Mode Host Code
1111 0xx	x	10-Bit Client Upper Byte[3]
1111 1xx	x	Reserved

Note:

1. The address bits listed here will never cause an address match independent of address mask settings.
2. This address will be Acknowledged only if GCEN = 1.
3. A match on this address can only occur on the upper byte in 10-Bit Addressing mode.

18.4 SMBus Support

The dsPIC33CK1024MP710 family devices have support for SMBus through options in the input voltage thresholds. There are two control bits to select one of three options: SMEN (I2CxCONL[8]) and Configuration bit, SMB3EN (FDEVOPT[10]). 18.5.1. I2CxCONL details the setting of these control bits.

Table 18-3. I^2C Pin Voltage Threshold

	SMEN SFR Bit (I2CxCONL[8])	SMB3EN Configuration Bit (FDEVOPT[10])
I^2C (default)	0	x
SMBus 2.0	1	0
SMBus 3.0	1	1

18.5.1 I2Cx Control Register Low

Name: I2CxCONL
Offset: 0x500, 0x51C, 0xF5C

Notes:

1. Automatically cleared to '0' at the beginning of Client transmission; automatically cleared to '0' at the end of Slave reception.
2. Automatically cleared to '0' at the beginning of Client transmission.

Legend: HC = Hardware Clearable bit

Bit 15 – I2CEN I2Cx Enable bit (writable from software only)

Value	Description
1	Enables the I2Cx module, and configures the SDAx and SCLx pins as serial port pins
0	Disables the I2Cx module; all I^2C pins are controlled by port functions

Bit 13 – I2CSIDL I2Cx Stop in Idle Mode bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bit 12 – SCLREL SCLx Release Control bit (I^2C Client mode only)(1)

If STREN = 1:(2)

User software may write '0' to initiate a clock stretch and write '1' to release the clock. Hardware clears at the beginning of every Client data byte transmission. Hardware clears at the end of every Client address byte reception. Hardware clears at the end of every Client data byte reception.

If STREN = 0:

User software may only write '1' to release the clock. Hardware clears at the beginning of every Client data byte transmission. Hardware clears at the end of every Client address byte reception.

Value	Description
1	Releases the SCLx clock
0	Holds the SCLx clock low (clock stretch)

Bit 11 – STRICT I2Cx Strict Reserved Address Rule Enable bit

Value	Description
1	Strict reserved addressing is enforced; for reserved addresses. (In Client Mode) – The device doesn't respond to reserved address space and addresses falling in that category are NACKed. (In Host Mode) – The device is allowed to generate addresses with reserved address space.
0	Reserved addressing would be Acknowledged. (In Client Mode) – The device will respond to an address falling in the reserved address space. When there is a match with any of the reserved addresses, the device will generate an ACK. (In Host Mode) – Reserved.

Bit 10 – A10M 10-Bit Client Address Flag bit

Value	Description
1	I2CxADD is a 10-bit Client address
0	I2CxADD is a 7-bit Client address

Bit 9 – DISSLW Slew Rate Control Disable bit

Value	Description
1	Slew rate control is disabled for Standard Speed mode (100 kHz, also disabled for 1 MHz mode)
0	Slew rate control is enabled for High-Speed mode (400 kHz)

Bit 8 – SMEN SMBus Input Levels Enable bit

Value	Description
1	Enables input logic so thresholds are compliant with the SMBus specification
0	Disables SMBus-specific inputs

Bit 7 – GCEN General Call Enable bit (in I^2C Client mode only)

Value	Description
1	Enables interrupt when a general call address is received in I2CxRSR; module is enabled for reception
0	General call address is disabled.

Bit 6 – STREN SCLx Clock Stretch Enable bit

In I^2C Client mode only; used in conjunction with the SCLREL bit.

Value	Description
1	Enables clock stretching
0	Disables clock stretching

Bit 5 – ACKDT Acknowledge Data bit

In I^2C Host mode during Host Receive mode. The value that will be transmitted when the user initiates an Acknowledge sequence at the end of a receive.

In I^2C Client mode when AHEN = 1 or DHEN = 1. The value that the Client will transmit when it initiates an Acknowledge sequence at the end of an address or data reception.

Value	Description
1	NACK is sent
0	ACK is sent

Bit 4 – ACKEN Acknowledge Sequence Enable bit

In I^2C Host mode only; applicable during Host Receive mode.

Value	Description
1	Initiates Acknowledge sequence on SDAx and SCLx pins, and transmits ACKDT data bit
0	Acknowledge sequence is Idle

Bit 3 – RCEN Receive Enable bit (in I^2C Host mode only)

Value	Description
1	Enables Receive mode for I^2C; automatically cleared by hardware at end of 8-bit receive data byte
0	Receive sequence is not in progress

Bit 2 – PEN Stop Condition Enable bit (in I^2C Host mode only)

Value	Description
1	Initiates Stop condition on SDAx and SCLx pins
0	Stop condition is Idle

Bit 1 – RSEN Restart Condition Enable bit (in I^2C Host mode only)

Value	Description
1	Initiates Restart condition on SDAx and SCLx pins
0	Restart condition is Idle

Bit 0 – SEN Start Condition Enable bit (in I^2C Host mode only)

Bit 5 – SCIE Start Condition Interrupt Enable bit

Value	Description
1	Enables interrupt on detection of Start or Restart conditions
0	Start detection interrupts are disabled

Bit 4 – BOEN Buffer Overwrite Enable bit

Value	Description
1	I2CxRCV is updated and an ACK is generated for a received address/data byte, ignoring the state of the I2COV bit only if RBF bit = 0
0	I2CxRCV is only updated when I2COV is clear

Bit 3 – SDAHT SDAx Hold Time Selection bit

Value	Description
1	Minimum of 300 ns hold time on SDAx after the falling edge of SCLx
0	Minimum of 100 ns hold time on SDAx after the falling edge of SCLx

Bit 2 – SBCDE Client Mode Bus Collision Detect Enable bit

If, on the rising edge of SCLx, SDAx is sampled low when the module is outputting a High state, the BCL bit is set and the bus goes Idle. This Detection mode is only valid during data and ACK transmit sequences.

Value	Description
1	Enables Client bus collision interrupts
0	Client bus collision interrupts are disabled

Bit 1 – AHEN Address Hold Enable bit

Value	Description
1	Following the 8th falling edge of SCLx for a matching received address byte; SCLREL bit (I2CxCONL[12]) will be cleared and the SCLx will be held low
0	Address holding is disabled

Bit 0 – DHEN Data Hold Enable bit

Value	Description
1	Following the 8th falling edge of SCLx for a received data byte; Client hardware clears the SCLREL bit (I2CxCONL[12]) and SCLx is held low
0	Data holding is disabled

Reset	0	0	0	0	0	0	0	0

Bit 15 – ACKSTAT Acknowledge Status bit (updated in all Host and Client modes)

Value	Description
1	Acknowledge was not received from Client
0	Acknowledge was received from Client

Bit 14 – TRSTAT Transmit Status bit (when operating as I^2C Host; applicable to Host transmit operation)

Value	Description
1	Host transmit is in progress (eight bits + ACK)
0	Host transmit is not in progress

Bit 13 – ACKTIM Acknowledge Time Status bit (valid in I^2C Client mode only)

Value	Description
1	Indicates I^2C bus is in an Acknowledge sequence, set on 8th falling edge of SCLx clock
0	Not an Acknowledge sequence, cleared on 9th rising edge of SCLx clock

Bit 10 – BCL Bus Collision Detect bit
(Host/Client mode; cleared when I^2C module is disabled, I2CEN = 0)

Value	Description
1	A bus collision has been detected during a Host or Client transmit operation
0	No bus collision has been detected

Bit 9 – GCSTAT General Call Status bit (cleared after Stop detection)

Value	Description
1	General call address was received
0	General call address was not received

Bit 8 – ADD10 10-Bit Address Status bit (cleared after Stop detection)

Value	Description
1	10-bit address was matched
0	10-bit address was not matched

Bit 7 – IWCOL I2Cx Write Collision Detect bit

Value	Description
1	An attempt to write to the I2CxTRN register failed because the I^2C module is busy; must be cleared in software
0	No collision

Bit 6 – I2COV I2Cx Receive Overflow Flag bit

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
1	A byte was received while the I2CxRCV register is still holding the previous byte; I2COV is a "don't care" in Transmit mode, must be cleared in software
0	No overflow

Bit 5 – D/$\overline{A}$ Data/$\overline{Address}$ bit (when operating as I^2C Client)

Value	Description
1	Indicates that the last byte received was data
0	Indicates that the last byte received or transmitted was an address

Bit 4 – P I2Cx Stop bit

Updated when Start, Reset or Stop is detected; cleared when the I^2C module is disabled, I2CEN = 0.

Value	Description
1	Indicates that a Stop bit has been detected last
0	Stop bit was not detected last

Bit 3 – S I2Cx Start bit

Updated when Start, Reset or Stop is detected; cleared when the I^2C module is disabled, I2CEN = 0.

Value	Description
1	Indicates that a Start (or Repeated Start) bit has been detected last
0	Start bit was not detected last

Bit 2 – R/$\overline{W}$ Read/$\overline{Write}$ Information bit (when operating as I^2C Client)

Value	Description
1	Read: Indicates the data transfer is output from the Client
0	Write: Indicates the data transfer is input to the Client

Bit 1 – RBF Receive Buffer Full Status bit

Value	Description
1	Receive is complete, I2CxRCV is full
0	Receive is not complete, I2CxRCV is empty

Bit 0 – TBF Transmit Buffer Full Status bit

Value	Description
1	Transmit is in progress, I2CxTRN is full (eight bits of data)
0	Transmit is complete, I2CxTRN is empty

19. Parallel Main Port (PMP)

Notes:

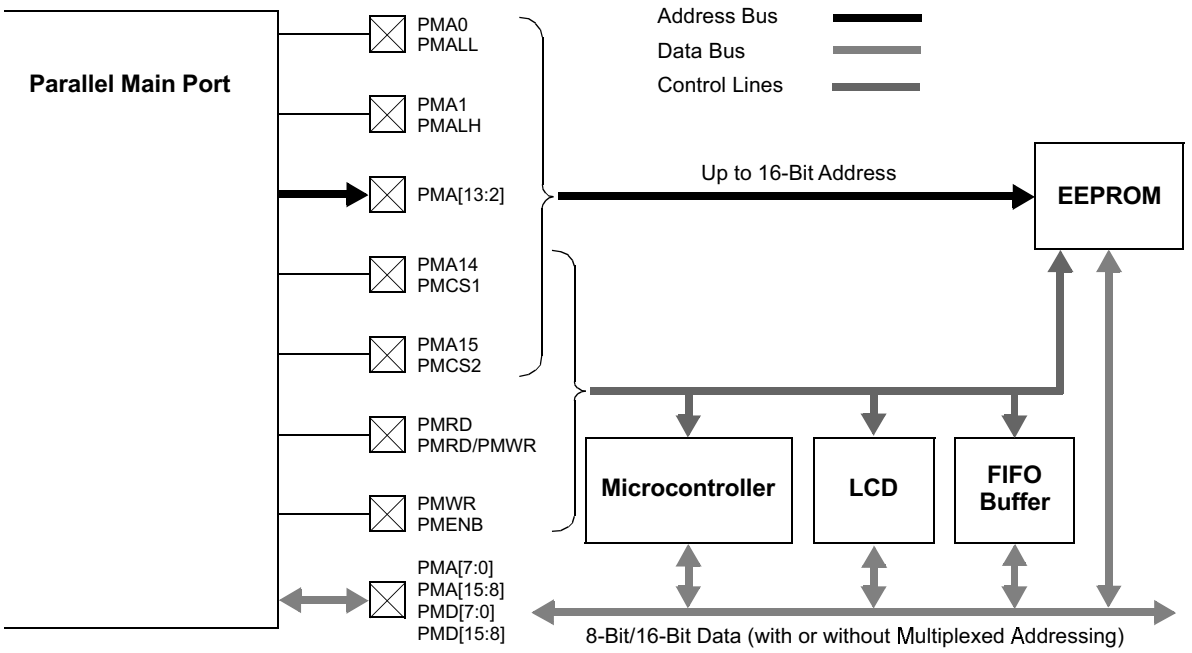

1. This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Parallel Main Port (PMP)"** (www.microchip.com/DS70005344).
2. Not all device variants include the PMP. Refer to dsPIC33CK1024MP710 Product Families for availability.

The Parallel Main Port (PMP) is a parallel 8-bit/16-bit I/O module specifically designed to communicate with a wide variety of parallel devices, such as communication peripherals, LCDs, external memory devices and microcontrollers. Because the interfaces to parallel peripherals vary significantly, the PMP module is highly configurable. The key features of the PMP module include:

- Main and Secondary Operating modes
- Up to 16 Programmable Address Lines
- Up to Two Chip Select Lines
- Programmable Strobe Options:
  - Individual read and write strobes or read/write strobe with enable strobe
- Address Auto-Increment/Auto-Decrement
- Programmable Address/Data Multiplexing
- Programmable Polarity on Control Signals
- Legacy Parallel Port Support
- Enhanced Parallel Support:
  - Address support
  - Four bytes deep, auto-incrementing buffer
- Schmitt Trigger or TTL Input Buffers
- Programmable Wait States
- Dual Buffer Mode with Separate Read and Write Registers
- Read Initiate Control

Bit 15 – ON Parallel Main Port Enable bit

Value	Description
1	PMP is enabled
0	PMP is disabled, no off-chip access is performed

Bit 13 – SIDL PMP Stop in Idle Mode bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation when device enters Idle mode

Bits 12:11 – ADRMUX[1:0] Address/Data Multiplexing Selection bits

Value	Description
11	All 16 bits of address are multiplexed with the 16 bits of data (PMPA[15:0]/PMPD[15:0]) using two phases
10	All 16 bits of address are multiplexed with the lower 8 bits of data (PMPA[15:8]/PMPA[7:0]/ PMPD[7:0]) using three phases
01	Lower 8 bits of address are multiplexed with the lower 8 bits of data (PMPA[7:0]/PMPD[7:0])
00	Address and data appear on separate pins

Bit 10 – PMPTTL PMP Module TTL Input Buffer Select bit

Value	Description
1	PMP module uses TTL input buffers
0	PMP module uses Schmitt Trigger input buffers

Bit 9 – PTWREN PMP Write Strobe Port Enable bit

Value	Description
1	PMWR/PMENB port is enabled
0	PMWR/PMENB port is disabled

Bit 8 – PTRDEN PMP Read/Write Strobe Port Enable bit

Value	Description
1	PMRD/PMWR port is enabled
0	PMRD/PMWR port is disabled

Bits 7:6 – CSF[1:0] Chip Select Function bits(1)

Value	Description
11	Reserved
10	PMCS2 and PMCS1 function as Chip Select
01	PMCS2 functions as Chip Select, PMCS1 functions as address bit

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
00	PMCS2 and PMCS1 function as address bits

Bit 5 – ALP Address Latch Polarity bit(1)

Value	Description
1	Active-high (PMALL and PMALH)
0	Active-low ($\overline{\text{PMALL}}$ and $\overline{\text{PMALH}}$)

Bit 4 – CS2P Chip Select 2 Polarity bit(1)

Value	Description
1	Active-high
0	Active-low

Bit 3 – CS1P Chip Select 1 Polarity bit(1)

Value	Description
1	Active-high
0	Active-low

Bit 1 – WRSP Write Strobe Polarity bit

For Client Modes and Host Mode 2 (MODE[1:0] (PMMODE[9:8]) = 00, 01, 10):
1 = Write strobe is active-high (PMWR)
0 = Write strobe is active-low ($\overline{\text{PMWR}}$)
For Host Mode 1 (MODE[1:0] (PMMODE[9:8]) = 11):
1 = Enables strobe active-high (PMENB)
0 = Enables strobe active-low ($\overline{\text{PMENB}}$)

Value	Description
1	PMRD/PMWR port is enabled
0	PMRD/PMWR port is disabled

Bit 0 – RDSP Read Strobe Polarity bit

For Client Modes and Host Mode 2 (MODE[1:0] (PMMODE[9:8]) = 00, 01, 10):
1 = Read strobe is active-high (PMRD)
0 = Read strobe is active-low ($\overline{\text{PMRD}}$)
For Host Mode 1 (MODE[1:0] (PMMODE[9:8]) = 11):
1 = Read/write strobe is active-high (PMRD/$\overline{\text{PMWR}}$)
0 = Read/write strobe is active-low ($\overline{\text{PMRD}}$/PMWR)

Value	Description
1	PMRD/PMWR port is enabled
0	PMRD/PMWR port is disabled

Access	R/W/HC						R/W	
Reset	0						0	

Bit 7 – RDSTART Start a Read on PMP Bus bit(1)

Value	Description
1	Starts a read cycle on the PMP bus
0	No effect

Bit 1 – DUALBUF PMP Dual Read/Write Buffers Enable bit (valid in Host mode only)

Value	Description
1	PMP uses separate registers for reads and writes (PMRADDR, PMDINx, PMWADDR, PMDOUTx)
0	PMP uses legacy registers (PMADDR, PMDINx)

19.1.3 Parallel Host Port Mode Register

Name: PMMODE
Offset: 0x1AC

Notes:

1. When WAITM[3:0] = 0000, the WAITBx and WAITEx bits are ignored and forced to 1 T_P (peripheral clock) cycle for a write operation; WAITBx = 1 T_P cycle, WAITEx = 0 T_P cycles for a read operation.
2. Address bits, A15 and A14, are not subject to auto-increment/decrement if configured as Chip Selects, CS2 and CS1.
3. These pins are active when MODE16 = 1 (16-bit mode).
4. The PMADDR register is always incremented/decremented by one, regardless of the transfer data width.

Legend: HC = Hardware Clearable bit; HS = Hardware Settable bit

Bit	15	14	13	12	11	10	9	8
	BUSY	IRQM[1:0]		INCM[1:0]		MODE16	MODE[1:0]

Bit 15 – BUSY Busy bit (Host mode only)

Value	Description
1	Port is busy
0	Port is not busy

Bits 14:13 – IRQM[1:0] Interrupt Request Mode bits

Value	Description
11	Reserved, do not use
10	Interrupt generated when Read Buffer 3 is read or Write Buffer 3 is written (Buffered PSP mode), or on a read or write operation when PMA[1:0] = 11 (Addressable Client mode only)
01	Interrupt generated at the end of the read/write cycle
00	No interrupt generated

Bits 12:11 – INCM[1:0] Increment Mode bits

Value	Description
11	Client mode read and write buffers auto-increment (MODE[1:0] (PMMODE[9:8]) = 00 only)
10	Decrements ADDR[15:0] by one every read/write cycle(2,4)
01	Increments ADDR[15:0] by one every read/write cycle(2,4)
00	No increment or decrement of address

Bit 10 – MODE16 8/16-Bit Mode bit

Value	Description
1	16-Bit Mode: A read or write to the Data register invokes a single 16-bit transfer
0	8-Bit Mode: A read or write to the Data register invokes a single 8-bit transfer

Bits 9:8 – MODE[1:0] PMP Mode Select bits

Value	Description
11	Host Mode 1 (PMCSx, PMRD, PMWR, PMENB, PMA[x:0], PMD[7:0] and PMD[8:15])(3)
10	Host Mode 2 (PMCSx, PMRD, PMWR, PMA[x:0], PMD[7:0] and PMD[8:15])(3)
01	Enhanced Client mode, controls signals (PMRD, PMWR, PMCS, PMD[7:0] and PMA[1:0])

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
00	Legacy Parallel Client Port mode, controls signals (PMRD, PMWR, PMCS and PMD[7:0])

Bits 7:6 – WAITB[1:0] Data Setup to Read/Write Strobe Wait States bits(1)

Value	Description
11	Data wait of 4 T_P; multiplexed address phase of 4 T_P
10	Data wait of 3 T_P; multiplexed address phase of 3 T_P
01	Data wait of 2 T_P; multiplexed address phase of 2 T_P
00	Data wait of 1 T_P; multiplexed address phase of 1 T_P **(default)**

Bits 5:2 – WAITM[3:0] Data Read/Write Strobe Wait States bits(1)

Value	Description
1111	Wait of 16 T_P
. . .	
0001	Wait of 2 T_P
0000	Wait of 1 T_P **(default)**

Bits 1:0 – WAITE[1:0] Data Hold After Read/Write Strobe Wait States bits(1)

11 = Wait of 4 T_P
10 = Wait of 3 T_P
01 = Wait of 2 T_P
00 = Wait of 1 T_P **(default)**

For Read Operations:

11 = Wait of 3 T_P
10 = Wait of 2 T_P
01 = Wait of 1 T_P
00 = Wait of 0 T_P **(default)**

20. Single-Edge Nibble Transmission (SENT)

Note: This data sheet summarizes the features of this group of dsPIC33CK1024MP710 family devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Single-Edge Nibble Transmission (SENT) Module"** (www.microchip.com/DS70005145).

The Single-Edge Nibble Transmission (SENT) module is based on the SAE J2716, *"SENT – Single-Edge Nibble Transmission for Automotive Applications"*. The SENT protocol is a one-way, single wire, time-modulated serial communication based on successive falling edges. It is intended for use in applications where high-resolution sensor data need to be communicated from a sensor to an Engine Control Unit (ECU).

The SENTx module has the following major features:

- Selectable Transmit or Receive mode
- Synchronous or Asynchronous Transmit modes
- Automatic Data Rate Synchronization
- Optional Automatic Detection of CRC Errors in Receive mode
- Optional Hardware Calculation of CRC in Transmit mode
- Support for Optional Pause Pulse Period
- Data Buffering for One Message Frame
- Selectable Data Length for Transmit/Receive, Up to Six Nibbles
- Automatic Detection of Framing Errors

SENT protocol timing is based on a predetermined time unit, T_{TICK}. Both the transmitter and receiver must be preconfigured for T_{TICK}, which can vary from 3 to 90 µs. A SENT message frame starts with a Sync pulse. The purpose of the Sync pulse is to allow the receiver to calculate the data rate of the message encoded by the transmitter. The SENT specification allows messages to be validated with up to a 20% variation in T_{TICK}. This allows for the transmitter and receiver to run from different clocks that may be inaccurate, and drift with time and temperature. The data nibbles are four bits in length and are encoded as the data value + 12 ticks. This yields a 0 value of 12 ticks and the maximum value, 0xF, of 27 ticks.

A SENT message consists of the following:

- A synchronization/calibration period of 56 tick times
- A status nibble of 12-27 tick times
- Up to six data nibbles of 12-27 tick times
- A CRC nibble of 12-27 tick times
- An optional pause pulse period of 12-768 tick times

Figure 20-1 shows a block diagram of the SENTx module.

Figure 20-2 shows the construction of a typical 6-nibble data frame, with the numbers representing the minimum or maximum number of tick times for each section.

Figure 20-1. SENTx Module Block Diagram

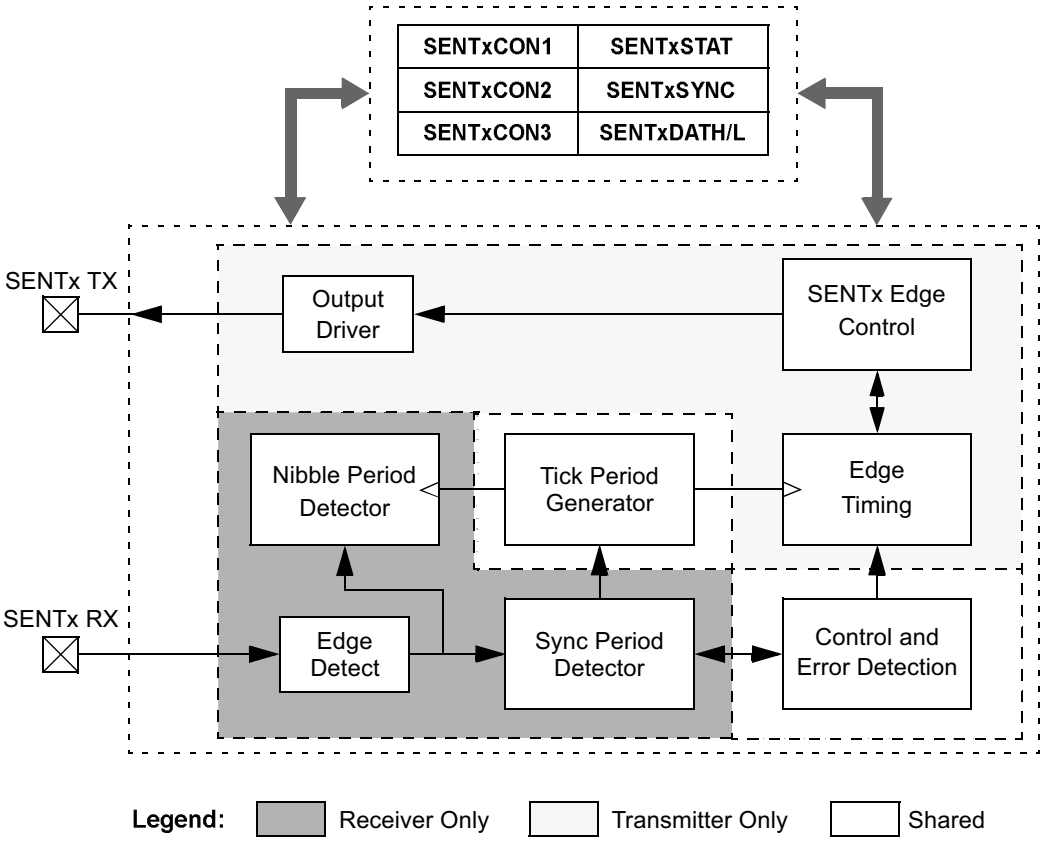

Figure 20-2. SENTx Protocol Data Frames

20.1 Transmit Mode

By default, the SENTx module is configured for transmit operation. The module can be configured for continuous asynchronous message frame transmission, or alternatively, for Synchronous mode triggered by software. When enabled, the transmitter will send a Sync, followed by the appropriate number of data nibbles, an optional CRC and optional pause pulse. The tick period used by the SENTx transmitter is set by writing a value to the TICKTIME[15:0] (SENTxCON2[15:0]) bits. The tick period calculations are shown in Equation 20-1.

Equation 20-1. Tick Period Calculation

$$TICKTIME[15:0] = \frac{T_{TICK}}{T_{CLK}} - 1$$

An optional pause pulse can be used in Asynchronous mode to provide a fixed message frame time period. The frame period used by the SENTx transmitter is set by writing a value to the FRAMETIME[15:0] (SENTxCON3[15:0]) bits. The formulas used to calculate the value of frame time are shown in Equation 20-2.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Equation 20-2. Frame Time Calculations

$$FRAMETIME[15:0] = T_{TICK}/T_{FRAME}$$

$$FRAMETIME[15:0] \geq 122 + 27N$$

$$FRAMETIME[15:0] \geq 848 + 12N$$

Where:
T_{FRAME} = Total time of the message from ms
N = The number of data nibbles in message, 1-6

Note: The module will not produce a pause period with less than 12 ticks, regardless of the FRAMETIME[15:0] value. FRAMETIME[15:0] values beyond 2047 will have no effect on the length of a data frame.

20.1.1 Transmit Mode Configuration

20.1.1.1 Initializing the SENTx Module

Perform the following steps to initialize the module:

1. Write RCVEN (SENTxCON1[11]) = 0 for Transmit mode.
2. Write TXM (SENTxCON1[10]) = 0 for Asynchronous Transmit mode or TXM = 1 for Synchronous mode.
3. Write NIBCNT[2:0] (SENTxCON1[2:0]) for the desired data frame length.
4. Write CRCEN (SENTxCON1[8]) for hardware or software CRC calculation.
5. Write PPP (SENTxCON1[7]) for optional pause pulse.
6. If PPP = 1, write TFRAME to SENTxCON3.
7. Write SENTxCON2 with the appropriate value for the desired tick period.
8. Enable interrupts and set interrupt priority.
9. Write initial status and data values to SENTxDATH/L.
10. If CRCEN = 0, calculate CRC and write the value to CRC[3:0] (SENTxDATL[3:0]).
11. Set the SNTEN (SENTxCON1[15]) bit to enable the module.

User software updates to SENTxDATH/L must be performed after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt to trigger data writes. The data should be read from the SENTxDATL/H registers after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt trigger.

20.2 Receive Mode

The module can be configured for receive operation by setting the RCVEN (SENTxCON1[11]) bit. The time between each falling edge is compared to SYNCMIN[15:0] (SENTxCON3[15:0]) and SYNCMAX[15:0] (SENTxCON2[15:0]), and if the measured time lies between the minimum and maximum limits, the module begins to receive data. The validated Sync time is captured in the SENTxSYNC register and the tick time is calculated. Subsequent falling edges are verified to be within the valid data width and the data are stored in the SENTxDATL/H registers. An interrupt event is generated at the completion of the message and the user software should read the SENTx Data registers before the reception of the next nibble. The equation for SYNCMIN[15:0] and SYNCMAX[15:0] is shown in Equation 20-3.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Equation 20-3. SYNCMIN[15:0] and SYNCMAX[15:0] Calculations

$$T_{TICK} = T_{CLK} \bullet (TICKTIME[15:0] + 1)$$
$$FRAMETIME[15:0] = T_{TICK}/T_{FRAME}$$
$$SyncCount = 8 \times F_{RCV} \times T_{TICK}$$
$$SYNCMIN[15:0] = 0.8 \times SyncCount$$
$$SYNCMAX[15:0] = 1.2 \times SyncCount$$
$$FRAMETIME[15:0] \geq 122 + 27N$$
$$FRAMETIME[15:0] \geq 848 + 12N$$

Where:
T_{FRAME} = Total time of the message from ms
N = The number of data nibbles in message, 1-6
F_{RCV} = FCY x Prescaler
T_{CLK} = FCY/Prescaler

For T_{TICK} = 3.0 µs and F_{CLK} = 4 MHz, SYNCMIN[15:0] = 76.

Note: To ensure a Sync period can be identified, the value written to SYNCMIN[15:0] must be less than the value written to SYNCMAX[15:0].

20.2.1 Initializing the SENTx Module

Perform the following steps to initialize the module:

1. Write RCVEN (SENTxCON1[11]) = 1 for Receive mode.
2. Write NIBCNT[2:0] (SENTxCON1[2:0]) for the desired data frame length.
3. Write CRCEN (SENTxCON1[8]) for hardware or software CRC validation.
4. Write PPP (SENTxCON1[7]) = 1 if pause pulse is present.
5. Write SENTxCON2 with the value of SYNCMAXx (Nominal Sync Period + 20%).
6. Write SENTxCON3 with the value of SYNCMINx (Nominal Sync Period – 20%).
7. Enable interrupts and set interrupt priority.
8. Set the SNTEN (SENTxCON1[15]) bit to enable the module.

The data should be read from the SENTxDATL/H registers after the completion of the CRC and before the next message frame's status nibble. The recommended method is to use the message frame completion interrupt trigger.

001 = Module is receiving Data Nibble 1 or was receiving this nibble when an error occurred
000 = Module is receiving a status nibble or waiting for Sync

Bit 3 – CRCERR CRC Status bit (Receive mode only)

Value	Description
1	A CRC error has occurred for the 1-6 data nibbles in SENTxDATL/H
0	A CRC error has not occurred

Bit 2 – FRMERR Framing Error Status bit (Receive mode only)

Value	Description
1	A data nibble was received with less than 12 tick periods or greater than 27 tick periods
0	Framing error has not occurred

Bit 1 – RXIDLE SENTx Receiver Idle Status bit (Receive mode only)

Value	Description
1	The SENTx data bus has been Idle (high) for a period of SYNCMAX[15:0] or greater
0	The SENTx data bus is not Idle

Bit 0 – SYNCTXEN SENTx Synchronization Period Status/Transmit Enable bit(1)

Module in Receive Mode (RCVEN = 1):

1 = A valid synchronization period was detected; the module is receiving nibble data

0 = No synchronization period has been detected; the module is not receiving nibble data

Module in Asynchronous Transmit Mode (RCVEN = 0, TXM = 0):

The bit always reads as '1' when the module is enabled, indicating the module transmits SENTx data frames continuously. The bit reads '0' when the module is disabled.

Module in Synchronous Transmit Mode (RCVEN = 0, TXM = 1):

1 = The module is transmitting a SENTx data frame

0 = The module is not transmitting a data frame, user software may set SYNCTXEN to start another data frame transmission

21. Timer1

Notes:

1. This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Timers"** (www.microchip.com/DS70362), which is available from the Microchip website (www.microchip.com/).
2. Some registers and associated bits described in this section may not be available on all devices. Refer to 4. Memory Organization in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer that can operate as a free-running interval timer/counter.

The Timer1 module has the following unique features over other timers:

- Can be Operated in Asynchronous Counter mode
- Asynchronous Timer
- Operational during CPU Sleep mode
- Software Selectable Prescalers 1:1, 1:8, 1:64 and 1:256
- External Clock Selection Control
- The Timer1 External Clock Input (T1CK) can Optionally be Synchronized to the Internal Device Clock and the Clock Synchronization is Performed after the Prescaler

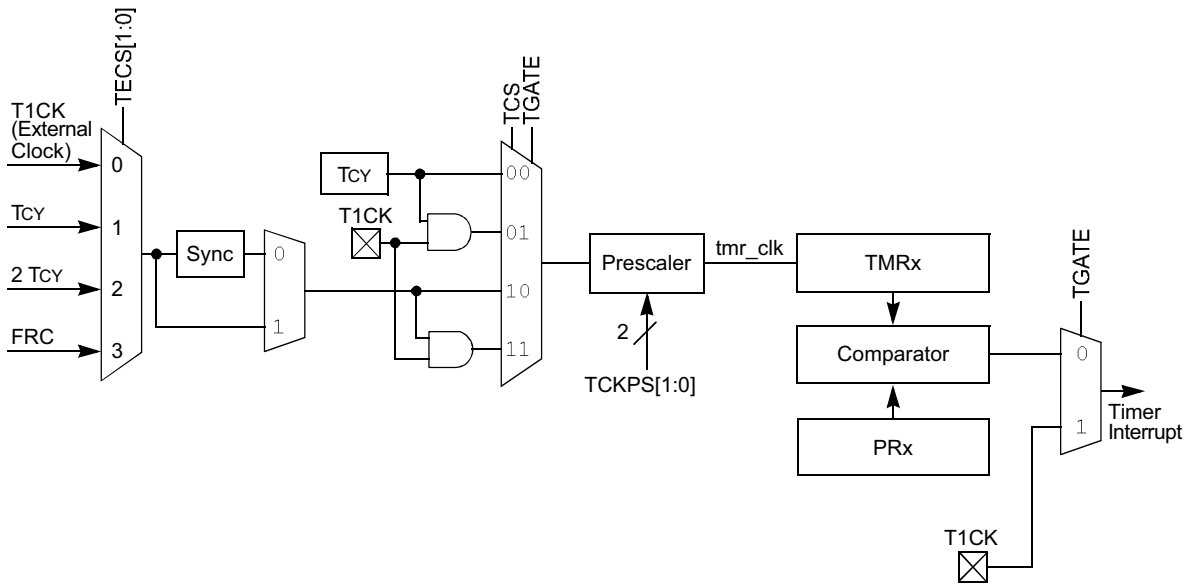

If Timer1 is used for SCCP, the timer should be running in Synchronous mode.

The Timer1 module can operate in one of the following modes:

- Timer mode
- Gated Timer mode
- Synchronous Counter mode
- Asynchronous Counter mode

A block diagram of Timer1 is shown in Figure 21-1.

22. Capture/Compare/PWM/Timer Modules (SCCP)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Capture/Compare/PWM/Timer (MCCP and SCCP)"** (www.microchip.com/DS30003035).

dsPIC33CK1024MP710 family devices include several Capture/Compare/PWM/Timer base modules, which provide the functionality of three different peripherals from earlier PIC24F devices. The module can operate in one of three major modes:

- General Purpose Timer
- Input Capture
- Output Compare/PWM

Single CCP output modules (SCCPs) provide only one PWM output.

The SCCP module can be operated only in one of the three major modes at any time. The other modes are not available unless the module is reconfigured for the new mode.

A conceptual block diagram for the module is shown in Figure 22-1. All three modes share a time base generator and a common Timer register pair (CCPxTMRH/L); other shared hardware components are added as a particular mode requires.

Each module has a total of six control and status registers:

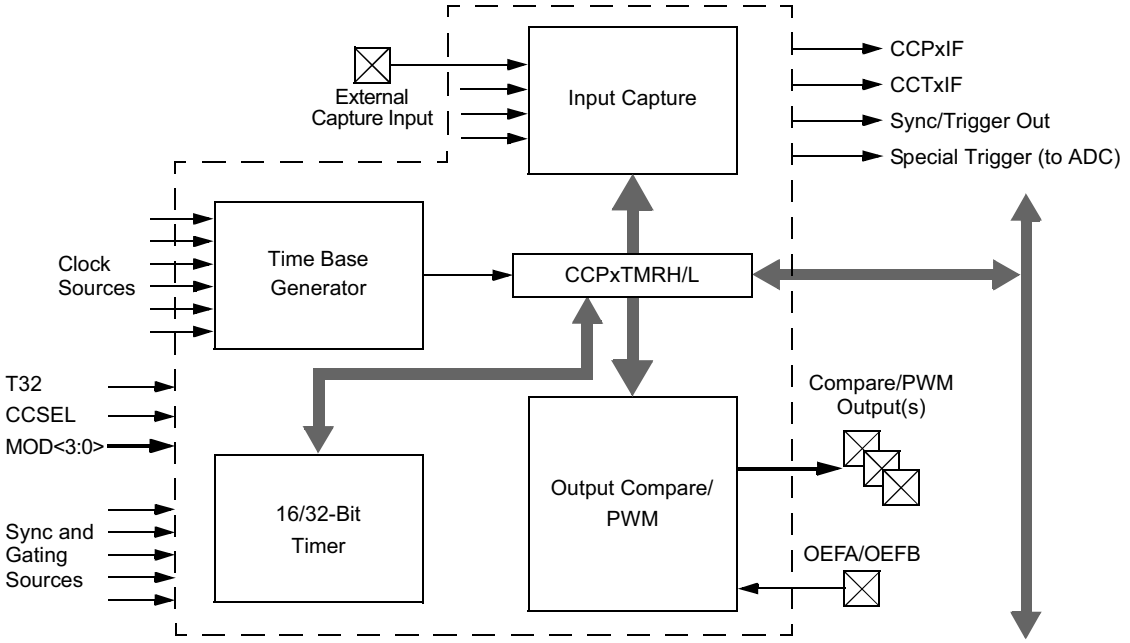

- CCPxCON1L
- CCPxCON1H
- CCPxCON2L
- CCPxCON2H
- CCPxCON3H
- CCPxSTATL

Each module also includes eight buffer/counter registers that serve as Timer Value registers or data holding buffers:

- CCPxTMRH/CCPxTMRL (CCPx Timer High/Low Counters)
- CCPxPRH/CCPxPRL (CCPx Timer Period High/Low)
- CCPxRA (CCPx Primary Output Compare Data Buffer)
- CCPxRB (CCPx Secondary Output Compare Data Buffer)
- CCPxBUFH/CCPxBUFL (CCPx Input Capture High/Low Buffers)

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Figure 22-1. SCCPx Conceptual Block Diagram

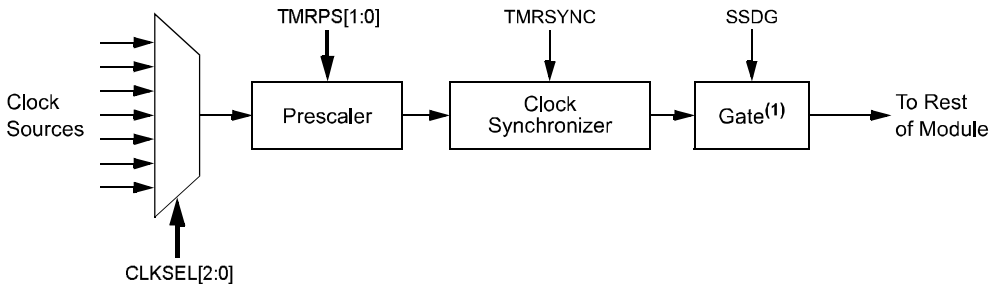

22.1 Time Base Generator

The Timer Clock Generator (TCG) generates a clock for the module's internal time base, using one of the clock signals already available on the microcontroller. This is used as the time reference for the module in its three major modes. The internal time base is shown in Figure 22-2.

There are eight inputs available to the clock generator, which are selected using the CLKSEL[2:0] bits (CCPxCON1L[10:8]). Available sources include the FRC, the Secondary Oscillator and the TCLKI External Clock inputs. The system clock is the default source (CLKSEL[2:0] = 000).

Figure 22-2. Timer Clock Generator

Note 1: Gating is available in Timer modes only.

22.2 General Purpose Timer

Timer mode is selected when CCSEL = 0 and MOD[3:0] = 0000. The timer can function as a 32-bit timer or a dual 16-bit timer, depending on the setting of the T32 bit (Table 22-1).

Table 22-1. Timer Operation Mode

T32 (CCPxCON1L[5])	Operating Mode
0	Dual Timer Mode (16-bit)

© 2022-2023 Microchip Technology Inc. and its subsidiaries

.....continued	
T32 (CCPxCON1L[5])	**Operating Mode**
1	Timer Mode (32-bit)

Dual 16-Bit Timer mode provides a simple timer function with two independent 16-bit timer/counters. The primary timer uses CCPxTMRL and CCPxPRL. Only the primary timer can interact with other modules on the device. It generates the SCCPx Sync out signals for use by other SCCP modules. It can also use the SYNC[4:0] bits' signal generated by other modules.

The secondary timer uses CCPxTMRH and CCPxPRH. It is intended to be used only as a periodic interrupt source for scheduling CPU events. It does not generate an output Sync/trigger signal like the primary time base. In Dual Timer mode, the CCPx Secondary Timer Period register, CCPxPRH, generates the SCCP compare event (CCPxIF) used by many other modules on the device.

The 32-Bit Timer mode uses the CCPxTMRL and CCPxTMRH registers, together, as a single 32-bit timer. When CCPxTMRL overflows, CCPxTMRH increments by one. This mode provides a simple timer function when it is important to track long time periods. Note that the T32 bit (CCPxCON1L[5]) should be set before the CCPxTMRL or CCPxPRH registers are written to initialize the 32-bit timer.

22.3 Output Compare Mode

Output Compare mode compares the Timer register value with the value of one or two Compare registers, depending on its mode of operation. The Output Compare x module, on compare match events, has the ability to generate a single output transition or a train of output pulses. Like most PIC® MCU peripherals, the Output Compare x module can also generate interrupts on a compare match event.

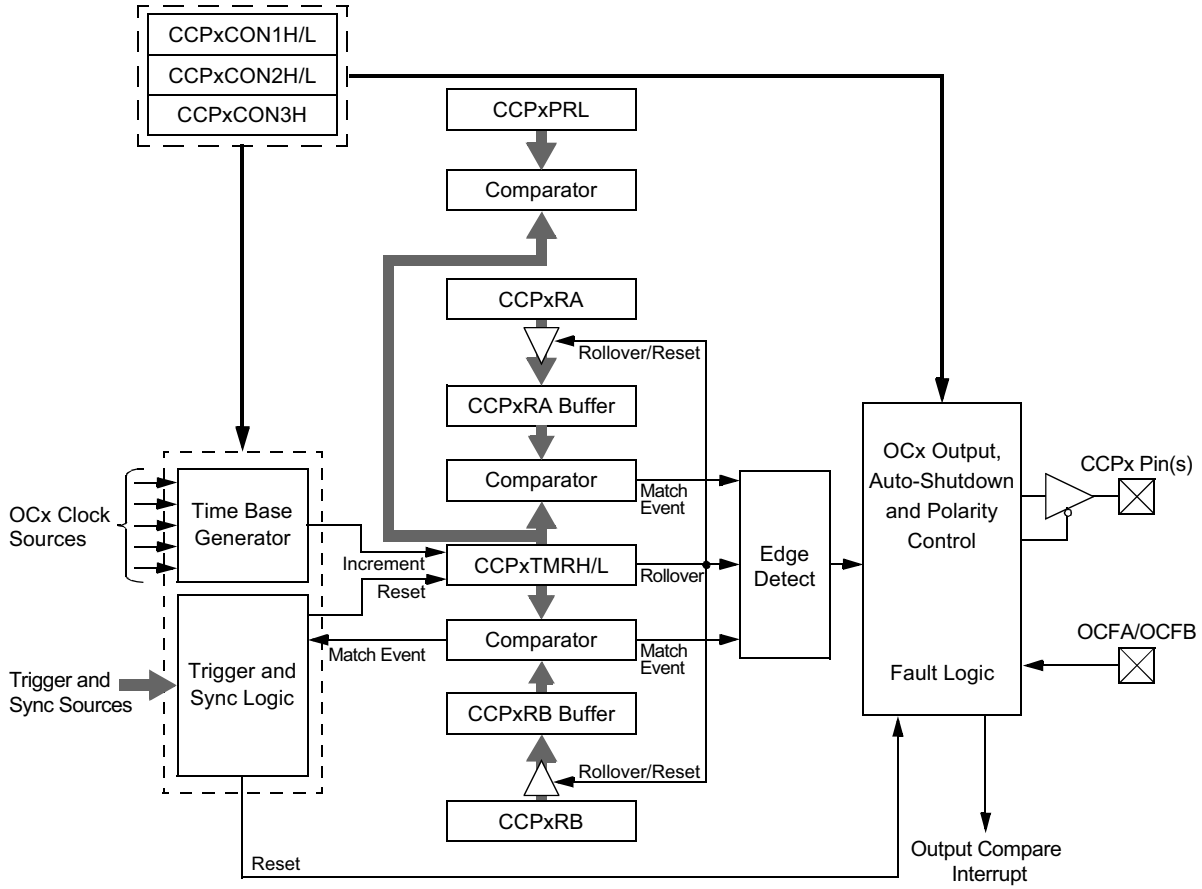

Table 22-2 shows the various modes available in Output Compare modes.

Table 22-2. Output Compare x/PWMx Modes

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode	
0001	0	Output High on Compare (16-bit)	Single Edge Mode
0001	1	Output High on Compare (32-bit)	
0010	0	Output Low on Compare (16-bit)

Figure 22-3. Output Compare x Block Diagram

22.4 Input Capture Mode

Input Capture mode is used to capture a timer value from an independent timer base, upon an event, on an input pin or other internal trigger source. The input capture features are useful in applications requiring frequency (time period) and pulse measurement. Figure 22-4 depicts a simplified block diagram of Input Capture mode.

Input Capture mode uses a dedicated 16/32-bit, synchronous, up counting timer for the capture function. The timer value is written to the FIFO when a capture event occurs. The internal value may be read (with a synchronization delay) using the CCPxTMRH/L registers.

To use Input Capture mode, the CCSEL bit (CCPxCON1L[4]) must be set. The T32 and the MOD[3:0] bits are used to select the proper Capture mode, as shown in Table 22-3.

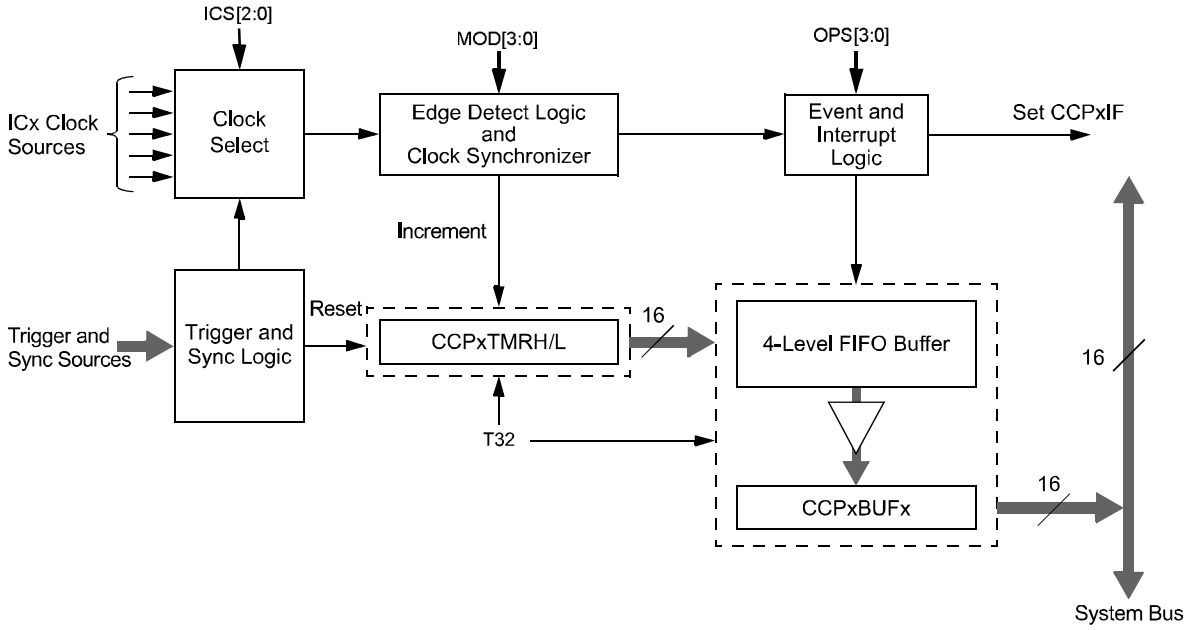

Table 22-3. Input Capture x Modes

MOD[3:0] (CCPxCON1L[3:0])	T32 (CCPxCON1L[5])	Operating Mode
0000	0	Edge Detect (16-bit capture)
0000	1	Edge Detect (32-bit capture)
0001	0	Every Rising (16-bit capture)

22.5 Auxiliary Output

The SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other SCCP modules, or other digital peripherals, to provide these types of functions:

- Time Base Synchronization
- Peripheral Trigger and Clock Inputs
- Signal Gating

The type of output signal is selected using the AUXOUT[1:0] control bits (CCPxCON2H[4:3]). The type of output signal is also dependent on the module operating mode.

Table 22-4. Auxiliary Output

Bit 15 – CCPON CCPx Module Enable bit

Value	Description
1	Module is enabled with an operating mode specified by the MOD[3:0] control bits
0	Module is disabled

Bit 13 – CCPSIDL CCPx Stop in Idle Mode Bit

Value	Description
1	Discontinues module operation when device enters Idle mode
0	Continues module operation in Idle mode

Bit 12 – CCPSLP CCPx Sleep Mode Enable bit

Value	Description
1	Module continues to operate in Sleep modes
0	Module does not operate in Sleep modes

Bit 11 – TMRSYNC Time Base Clock Synchronization bit

Value	Description
1	Asynchronous module time base clock is selected and synchronized to the internal system clocks (CLKSEL[2:0] ≠ 000)
0	Synchronous module time base clock is selected and does not require synchronization (CLKSEL[2:0] = 000)

Bits 10:8 – CLKSEL[2:0] CCPx Time Base Clock Select bits

Value	Description
111	External CCP TCKIx
110	CLC4
101	CLC3
100	CLC2
011	CLC1
010	F_{OSC}
001	Reference Clock (REFCLKO)

Bits 7:6 – TMRPS[1:0] Time Base Prescale Select bits

Value	Description
11	1:64 Prescaler
10	1:16 Prescaler
01	1:4 Prescaler

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
00	1:1 Prescaler

Bit 5 – T32 32-Bit Time Base Select bit

Value	Description
1	Uses 32-bit time base for timer, single edge output compare or input capture function
0	Uses 16-bit time base for timer, single edge output compare or input capture function

Bit 4 – CCSEL Capture/Compare Mode Select bit

Value	Description
1	Input Capture peripheral
0	Output Compare/PWM/Timer peripheral (exact function is selected by the MOD[3:0] bits)

Bits 3:0 – MOD[3:0] CCPx Mode Select bits

For CCSEL = 1 (Input Capture modes):

Value	Description
1xxx	Reserved
011x	Reserved
0101	Capture every 16th rising edge
0100	Capture every 4th rising edge
0011	Capture every rising and falling edge
0010	Capture every falling edge
0001	Capture every rising edge
0000	Capture every rising and falling edge (Edge Detect mode)

For CCSEL = 0 (Output Compare/Timer modes):

Value	Description
1111	External Input mode: Pulse generator is disabled, source is selected by ICS[2:0]
1110	Reserved
110x	Reserved
10xx	Reserved
0111	Variable Frequency Pulse mode(1)
0110	Center Aligned Pulse Compare mode, buffered(1)
0101	Dual Edge Compare mode, buffered
0100	Dual Edge Compare mode
0011	16-Bit/32-Bit Single Edge mode, toggles output on compare match
0010	16-Bit/32-Bit Single Edge mode, drives output low on compare match
0001	16-Bit/32-Bit Single Edge mode, drives output high on compare match
0000	16-Bit/32-Bit Timer mode, output functions are disabled

22.6.2 CCPx Control 1 High Register

Name: CCPxCON1H
Offset: 0x952, 0x976, 0x99A, 0x9BE, 0x9E2, 0xA06, 0xA2A, 0xA4E, 0xA72

Notes:

1. This control bit has no function in Input Capture modes.
2. This control bit has no function when TRIGEN = 0.
3. Output postscale settings, from 1:5 to 1:16 (0100-1111), will result in a FIFO buffer overflow for Input Capture modes.

Bit 15 – OPSSRC Output Postscaler Source Select bit(1)

Value	Description
1	Output postscaler scales module trigger output events
0	Output postscaler scales time base interrupt events

Bit 14 – RTRGEN Retrigger Enable bit(2)

Value	Description
1	Time base can be retriggered when TRIGEN bit = 1
0	Time base may not be retriggered when TRIGEN bit = 1

Bits 11:8 – OPS3[3:0] CCPx Interrupt Output Postscale Select bits(3)

Value	Description
1111	Interrupt every 16th time base period match
1110	Interrupt every 15th time base period match
. . .	
0100	Interrupt every 5th time base period match
0011	Interrupt every 4th time base period match or 4th input capture event
0010	Interrupt every 3rd time base period match or 3rd input capture event
0001	Interrupt every 2nd time base period match or 2nd input capture event
0000	Interrupt after each time base period match or input capture event

Bit 7 – TRIGEN CCPx Trigger Enable bit

Value	Description
1	Trigger operation of time base is enabled
0	Trigger operation of time base is disabled

Bit 6 – ONESHOT One-Shot Trigger Mode Enable bit

Value	Description
1	One-Shot Trigger mode is enabled; trigger duration is set by OSCNT[2:0]
0	One-Shot Trigger mode is disabled

Bit 5 – ALTSYNC CCPx Clock Select bits

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
1	An alternate signal is used as the module synchronization output signal
0	The module synchronization output signal is the Time Base Reset/rollover event

Bits 4:0 – SYNC[4:0] CCPx Synchronization Source Select bits
See 22.6.15. Synchronization Sources for the definition of inputs.

Bit 15 – PWMRSEN CCPx PWM Restart Enable bit

Value	Description
1	ASEVT bit clears automatically at the beginning of the next PWM period, after the shutdown input has ended
0	ASEVT bit must be cleared in software to resume PWM activity on output pins

Bit 14 – ASDGM CCPx Auto-Shutdown Gate Mode Enable bit

Value	Description
1	Waits until the next Time Base Reset or rollover for shutdown to occur
0	Shutdown event occurs immediately

Bit 12 – SSDG CCPx Software Shutdown/Gate Control bit

Value	Description
1	Manually forces auto-shutdown, timer clock gate or input capture signal gate event (setting of ASDGM bit still applies)
0	Normal module operation

Bits 7:0 – ASDG[7:0] CCPx Auto-Shutdown/Gating Source Enable bits

Value	Description
1	ASDGx Source n is enabled (see 22.6.16. Auto-Shutdown and Gating Sources for auto-shutdown/gating sources)
0	ASDGx Source n is disabled

Bit 15 – OENSYNC Output Enable Synchronization bit

Value	Description
1	Update by output enable bits occurs on the next Time Base Reset or rollover
0	Update by output enable bits occurs immediately

Bit 8 – OCAEN Output Enable/Steering Control bit

Value	Description
1	OCx pin is controlled by the CCPx module and produces an output compare or PWM signal
0	OCx pin is not controlled by the CCPx module; the pin is available to the port logic or another peripheral multiplexed on the pin

Bits 7:6 – ICGSM[1:0] Input Capture Gating Source Mode Control bits

Value	Description
11	Reserved
10	One-Shot mode: Falling edge from gating source disables future capture events (ICDIS = 1)
01	One-Shot mode: Rising edge from gating source enables future capture events (ICDIS = 0)
00	Level-Sensitive mode: A high level from gating source will enable future capture events; a low level will disable future capture events

Bits 4:3 – AUXOUT[1:0] Auxiliary Output Signal on Event Selection bits

Value	Description
11	Input capture or output compare event; no signal in Timer mode
10	Signal output is defined by module operating mode (see 22.5. Auxiliary Output)
01	Time base rollover event (all modes)
00	Disabled

Bits 2:0 – ICS[2:0] Input Capture Source Select bits

Value	Description
111	CLC4 Output
110	CLC3 Output
101	CLC2 Output
100	CLC1 Output
011	Comparator 3
010	Comparator 2
001	Comparator 1
000	SCCP Input Capture x (ICx) pin (PPS)

Bit 15 – OETRIG CCPx Dead-Time Select bit

Value	Description
1	For Triggered mode (TRIGEN = 1): Module does not drive enabled output pins until triggered
0	Normal output pin operation

Bits 14:12 – OSCNT[2:0] One-Shot Event Count bits

Value	Description
111	Extends one-shot event by 7 time base periods (8 time base periods total)
110	Extends one-shot event by 6 time base periods (7 time base periods total)
101	Extends one-shot event by 5 time base periods (6 time base periods total)

001	Extends one-shot event by 1 time base period (2 time base periods total)
000	Does not extend one-shot trigger event

Bit 5 – POLACE CCPx Output Pins, OCxA, OCxC and OCxE, Polarity Control bit

Value	Description
1	Output pin polarity is active-low
0	Output pin polarity is active-high

Bits 3:2 – PSSACE[1:0] PWMx Output Pins, OCxA, OCxC and OCxE, Shutdown State Control bits

Value	Description
11	Pins are driven active when a shutdown event occurs
10	Pins are driven inactive when a shutdown event occurs
0x	Pins are in a High-Impedance state when a shutdown event occurs

Bits 1:0 – PSSBDF[1:0] PWMx Output Pins, OCMxB, OCMxD and OCMxF, Shutdown State Control bits

Value	Description
11	Pins are driven active when a shutdown event occurs
10	Pins are driven inactive when a shutdown event occurs
0x	Pins are in a High-Impedance state when a shutdown event occurs

Value	Description
1	Input capture gating logic is armed for a one-shot gate event when ICGSM[1:0] = 01 or 10; bit always reads as '0'
0	Input capture gating logic is not armed for a one-shot gate event when ICGSM[1:0] = 01 or 10; bit always reads as '0'

Bit 7 – CCPTRIG CCPx Trigger Status bit

Value	Description
1	Timer has been triggered and is running
0	Timer has not been triggered and is held in Reset

Bit 6 – TRSET CCPx Trigger Set Request bit

Writes '1' to this location to trigger the timer when TRIGEN = 1 (location always reads as '0').

Bit 5 – TRCLR CCPx Trigger Clear Request bit

Writes '1' to this location to cancel the timer trigger when TRIGEN = 1 (location always reads as '0').

Bit 4 – ASEVT CCPx Auto-Shutdown Event Status/Control bit

Value	Description
1	A shutdown event is in progress; CCPx outputs are in the Shutdown state
0	CCPx outputs operate normally

Bit 3 – SCEVT Single Edge Compare Event Status bit

Value	Description
1	A single edge compare event has occurred
0	A single edge compare event has not occurred

23. Configurable Logic Cell (CLC)

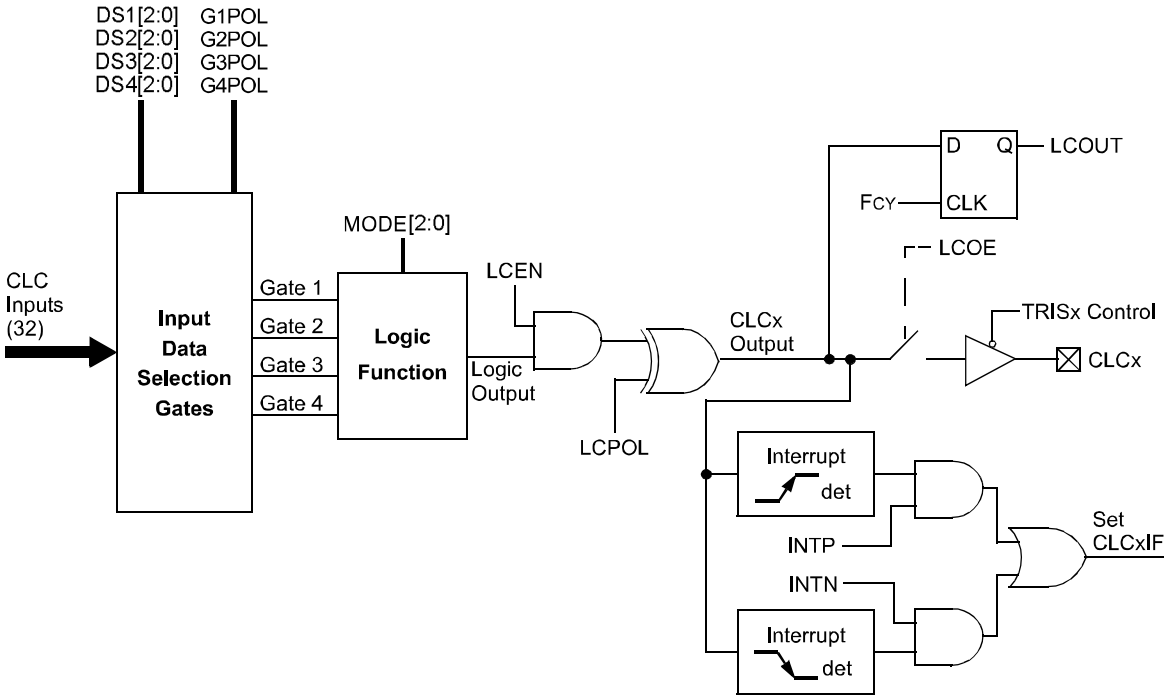

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"Configurable Logic Cell (CLC)"** (www.microchip.com/DS70005298). The information in this data sheet supersedes the information in the FRM.

The Configurable Logic Cell (CLC) module allows the user to specify combinations of signals as inputs to a logic function and to use the logic output to control other peripherals or I/O pins. This provides greater flexibility and potential in embedded designs, since the CLC module can operate outside the limitations of software execution, and supports a vast amount of output designs.

There are four input gates to the selected logic function. These four input gates select from a pool of up to 32 signals that are selected using four data source selection multiplexers.

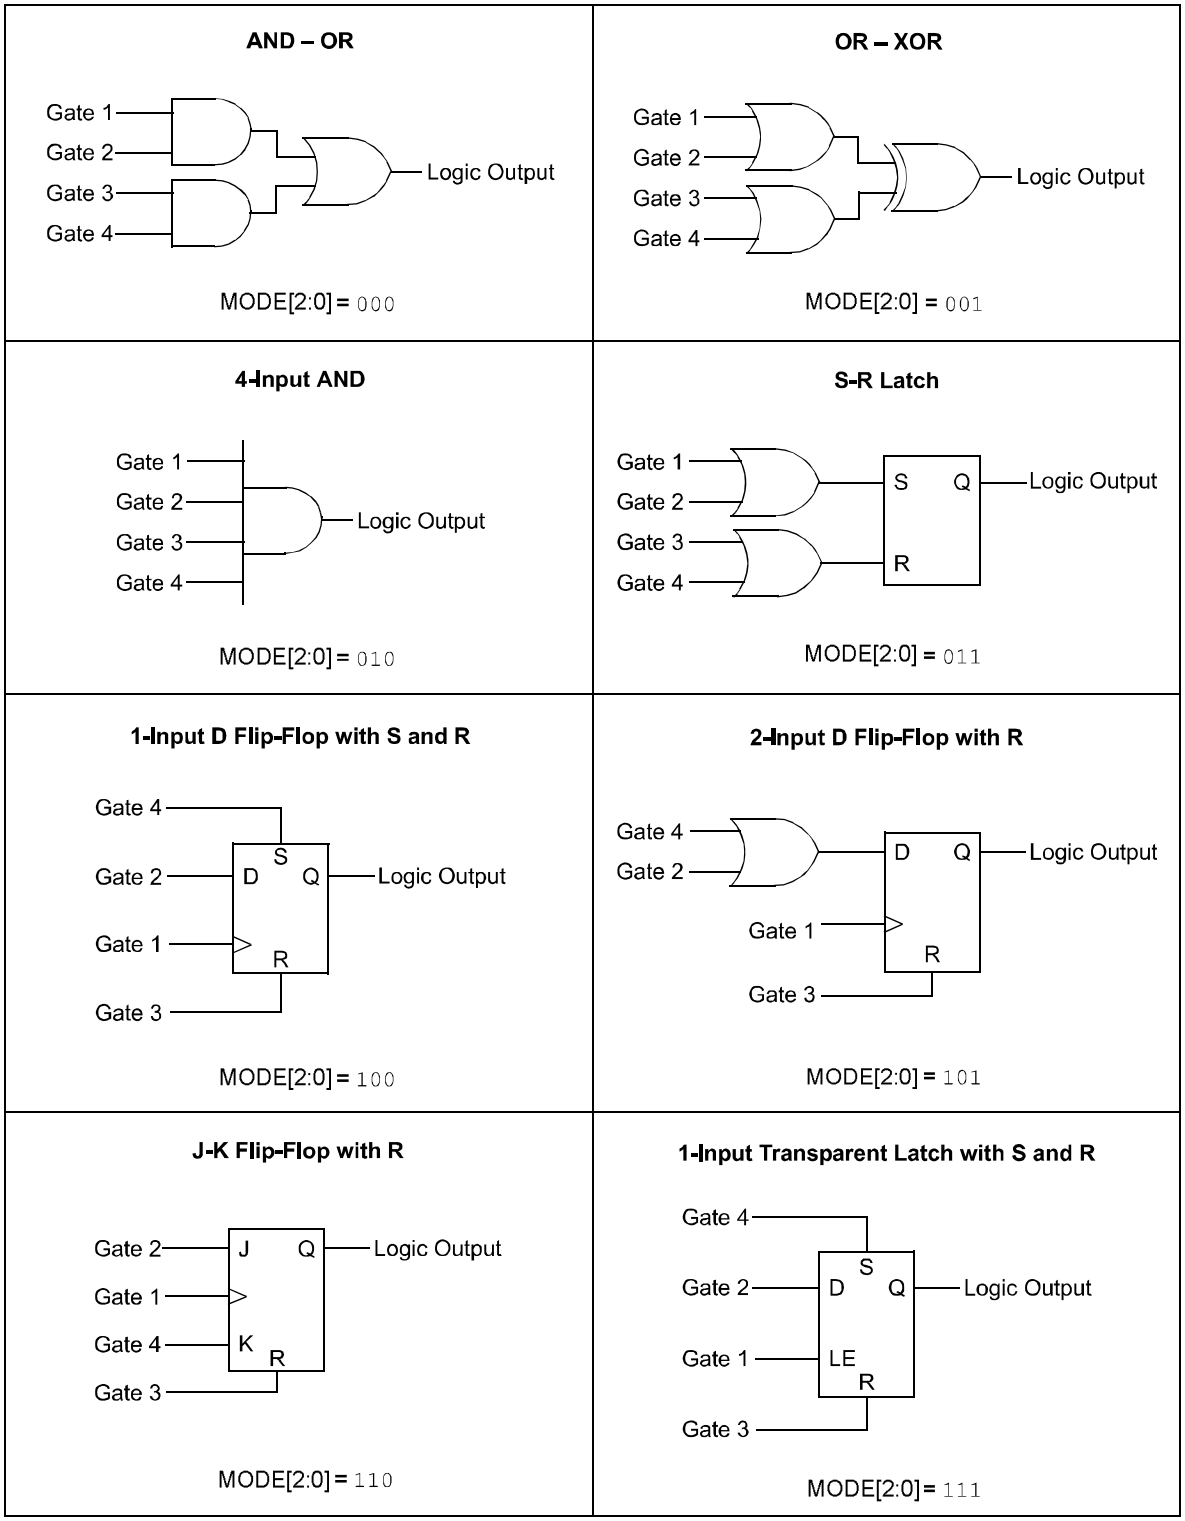

Figure 23-1 shows the details of the data source multiplexers and Figure 23-2 shows the logic input gate connections.

24. Peripheral Trigger Generator (PTG)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Peripheral Trigger Generator (PTG)"** (www.microchip.com/DS70000669).

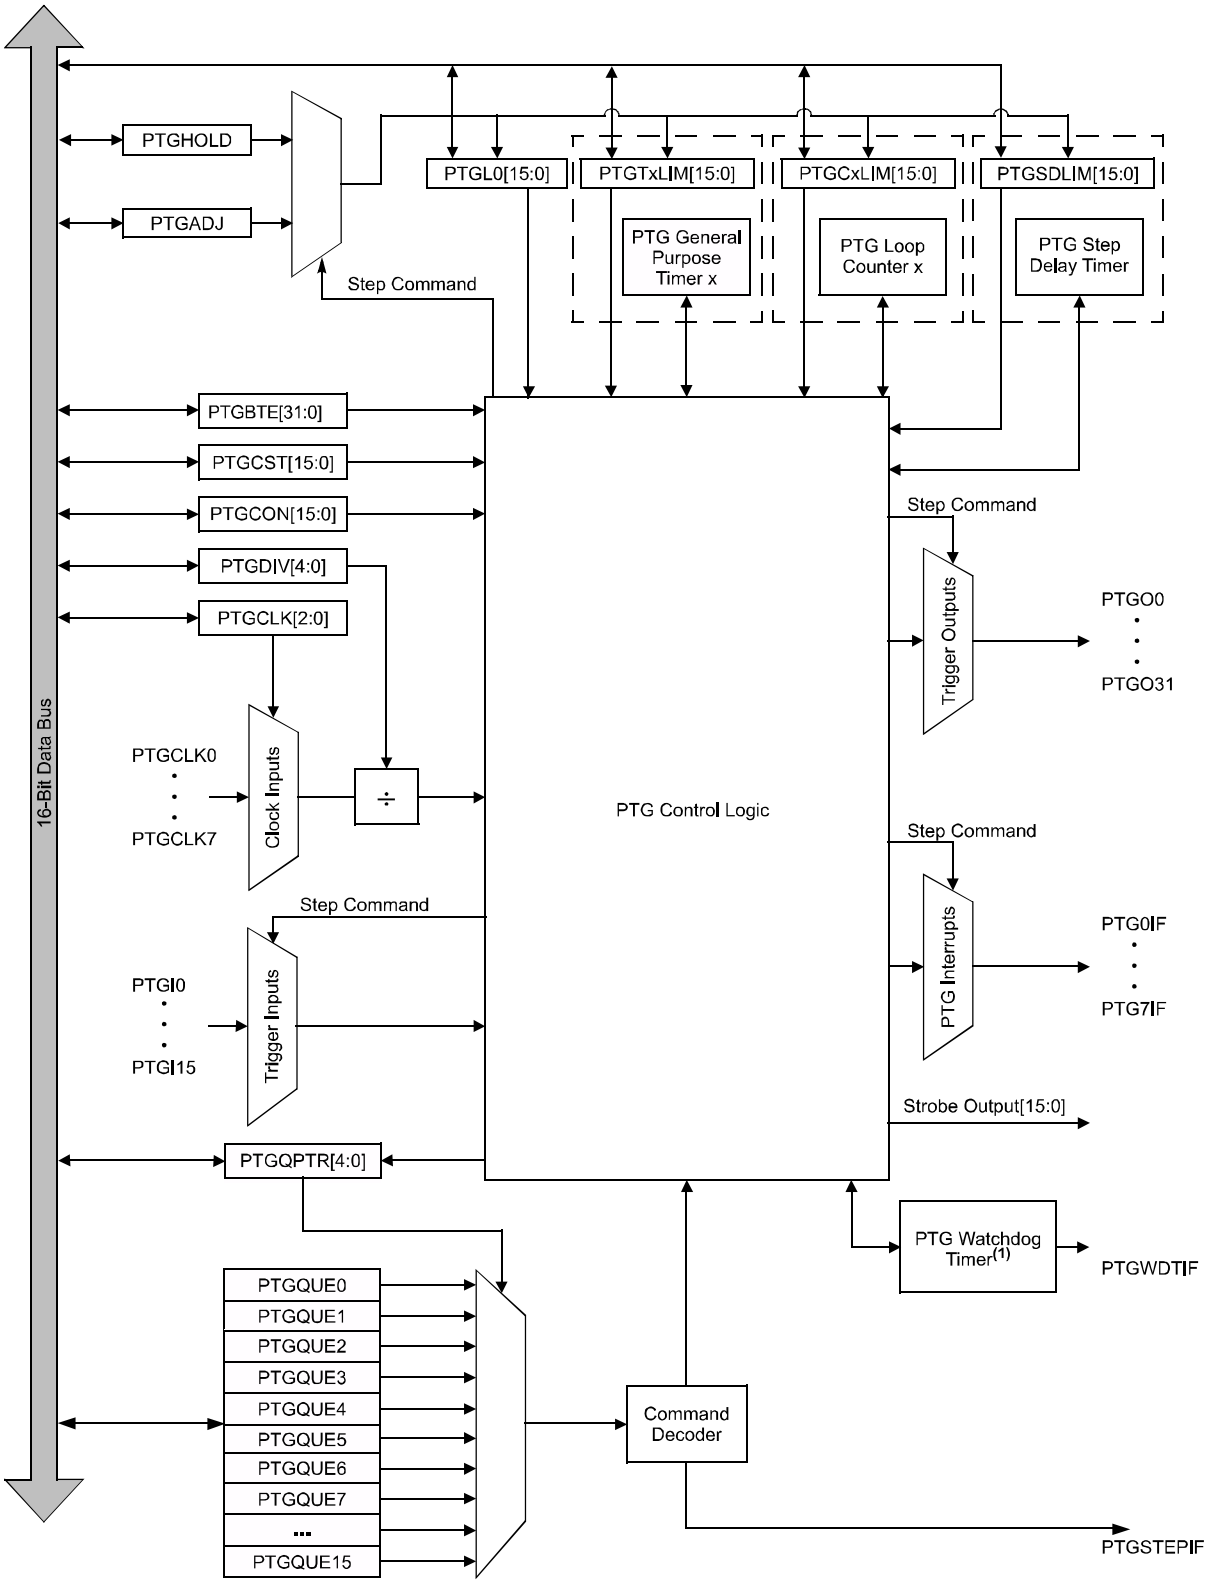

The dsPIC33CK1024MP710 family Peripheral Trigger Generator (PTG) module is a user-programmable sequencer that is capable of generating complex trigger signal sequences to coordinate the operation of other peripherals. The PTG module is designed to interface with other modules, such as an Analog-to-Digital Converter (ADC), output compare and PWM modules, timers and interrupt controllers.

24.1 Features

- Behavior is Step Command Driven:
  - Step commands are eight bits wide
- Commands are Stored in a Step Queue:
  - Queue depth is up to 32 entries
  - Programmable Step execution time (Step delay)
- Supports the Command Sequence Loop:
  - Can be nested one-level deep
  - Conditional or unconditional loop
  - Two 16-bit loop counters
- 15 Hardware Input Triggers:
  - Sensitive to either positive or negative edges, or a high or low level
- One Software Input Trigger
- Generates up to 32 Unique Output Trigger Signals
- Generates Two Types of Trigger Outputs:
  - Individual
  - Broadcast
- Strobed Output Port for Literal Data Values:
  - 5-bit literal write (literal part of a command)
  - 16-bit literal write (literal held in the PTGL0 register)
- Generates up to Ten Unique Interrupt Signals
- Two 16-Bit General Purpose Timers
- Flexible Self-Contained Watchdog Timer (WDT) to Set an Upper Limit to Trigger Wait Time
- Single-Step Command Capability in Debug mode
- Selectable Clock (System, Pulse-Width Modulator (PWM) or ADC)
- Programmable Clock Divider

24.2.1 PTG Control/Status Low Register

Name: PTGCST
Offset: 0x900

Notes:

1. These bits apply to the PTGWHI and PTGWLO commands only.
2. This bit is only used with the PTGCTRL Step command software trigger option.
3. The PTGSSEN bit may only be written when in Debug mode.

Bit	15	14	13	12	11	10	9	8

Bit 15 – PTGEN PTG Broadcast Trigger Enable bit

Value	Description
1	PTG is enabled
0	PTG is disabled

Bit 13 – PTGSIDL PTG Freeze in Debug Mode bit

Value	Description
1	Halts PTG operation when device is Idle
0	PTG operation continues when device is Idle

Bit 12 – PTGTOGL PTG Toggle Trigger Output bit

Value	Description
1	Toggles state of TRIG output for each execution of PTGTRIG
0	Generates a single TRIG pulse for each execution of PTGTRIG

Bit 10 – PTGSWT PTG Software Trigger bit(2)

Value	Description
1	If the PTG state machine is executing the "Wait for software trigger" Step command (OPTION[3:0] = 1010 or 1011), the command will complete and execution will continue
0	No action other than to clear the bit

Bit 9 – PTGSSEN PTG Single-Step Command bit(3)

Value	Description
1	Enables single Step when in Debug mode
0	Disables single Step

Bit 8 – PTGIVIS PTG Counter/Timer Visibility bit

Value	Description
1	Reading the PTGSDLIM, PTGCxLIM or PTGTxLIM register returns the current values of their corresponding Counter/Timer registers (PTGSDLIM, PTGCxLIM and PTGTxLIM)
0	Reading the PTGSDLIM, PTGCxLIM or PTGTxLIM register returns the value of these Limit registers

Bit 7 – PTGSTRT PTG Start Sequencer bit

Value	Description
1	Starts to sequentially execute the commands (Continuous mode)

© 2022-2023 Microchip Technology Inc. and its subsidiaries

Value	Description
0	Stops executing the commands

Bit 6 – PTGWDTO PTG Watchdog Timer Time-out Status bit

Value	Description
1	PTG Watchdog Timer has timed out
0	PTG Watchdog Timer has not timed out

Bit 5 – PTGBUSY PTG State Machine Busy bit

Value	Description
1	PTG is running on the selected clock source; no SFR writes are allowed to PTGCLK[2:0] or PTGDIV[4:0]
0	PTG state machine is not running

Bits 1:0 – PTGITM[1:0] PTG Input Trigger Operation Selection bits(1)

Value	Description
11	Single-level detect with Step delay not executed on exit of command (regardless of the PTGCTRL command) (Mode 3)
10	Single-level detect with Step delay executed on exit of command (Mode 2)
01	Continuous edge detect with Step delay not executed on exit of command (regardless of the PTGCTRL command) (Mode 1)
00	Continuous edge detect with Step delay executed on exit of command (Mode 0)

11110	Divide-by-31
. . .	
00001	Divide-by-2
00000	Divide-by-1

Bits 7:4 – PTGPWD[3:0] PTG Trigger Output Pulse-Width (in PTG clock cycles) bits

Value	Description
1111	All trigger outputs are 16 PTG clock cycles wide
1110	All trigger outputs are 15 PTG clock cycles wide
. . .	
0001	All trigger outputs are 2 PTG clock cycles wide
0000	All trigger outputs are 1 PTG clock cycle wide

Bits 2:0 – PTGWDT[2:0] PTG Watchdog Timer Time-out Selection bits

Value	Description
111	Watchdog Timer will time out after 512 PTG clocks
110	Watchdog Timer will time out after 256 PTG clocks
101	Watchdog Timer will time out after 128 PTG clocks
100	Watchdog Timer will time out after 64 PTG clocks
011	Watchdog Timer will time out after 32 PTG clocks
010	Watchdog Timer will time out after 16 PTG clocks
001	Watchdog Timer will time out after 8 PTG clocks
000	Watchdog Timer is disabled

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGSDLIM[15:0] PTG Step Delay Limit Register bits
This register holds a PTG Step delay value representing the number of additional PTG clocks between the start of a Step command and the completion of a Step command.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

24.2.9 PTG Counter 0 Limit Register

Name: PTGC0LIM(1)
Offset: 0x918

Note:

1. This register is read-only when the module is executing Step commands.

Bit	15	14	13	12	11	10	9	8

Reset	0	0	0	0	0	0	0	0

Bits 15:0 – PTGADJ[15:0] PTG Adjust Register bits
This register holds the user-supplied data to be added to the PTGTxLIM, PTGCxLIM, PTGSDLIM or PTGL0 register using the `PTGADD` command.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

24.2.12 PTG Literal 0 Register

Name: PTGL0(1,2)
Offset: 0x924

Notes:

1. This register is read-only when the module is executing Step commands.
2. The PTG strobe output is typically connected to the ADC Channel Select register. This allows the PTG to directly control ADC channel switching. See the specific device data sheet for connections of the PTG output.

Bit	15	14	13	12	11	10	9	8
	PTGL0[15:8]							
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0

Bits 15:8 – STEP2n[7:0] PTG Command 2n bits(2)
A queue location for storage of the STEP2n command byte, , where 'n' is the even numbered Step Queue Pointers.

Bits 7:0 – STEP2n[7:0] PTG Command 2n bits(2)
A queue location for storage of the STEP2n command byte, where 'n' is the odd numbered Step Queue Pointers.

	PTGCTRL	0000	Execute the control command as described by the OPTION[3:0] bits.
	PTGADD	0001	Add contents of the PTGADJ register to the target register as described by the OPTION[3:0] bits.
	PTGCOPY		Copy contents of the PTGHOLD register to the target register as described by the OPTION[3:0] bits.
	PTGSTRB	001x	Copy the values contained in the bits, CMD[0]:OPTION[3:0], to the strobe output bits[4:0].
	PTGWHI	0100	Wait for a low-to-high edge input from a selected PTG trigger input as described by the OPTION[3:0] bits.
	PTGWLO	0101	Wait for a high-to-low edge input from a selected PTG trigger input as described by the OPTION[3:0] bits.
	—	0110	Reserved; do not use.(3)
	PTGIRQ	0111	Generate individual interrupt request as described by the OPTION[3:0] bits.
	PTGTRIG	100x	Generate individual trigger output as described by the bits, CMD[0]:OPTION[3:0].
	PTGJMP	101x	Copy the values contained in the bits, CMD[0]:OPTION[3:0], to the PTGQPTR register and jump to that Step queue.
	PTGJMPC0	110x	PTGC0 = PTGC0LIM: Increment the PTGQPTR register.
			PTGC0 ≠ PTGC0LIM: Increment Counter 0 (PTGC0) and copy the values contained in the bits, CMD[0]:OPTION[3:0], to the PTGQPTR register, and jump to that Step queue.
	PTGJMPC1	111x	PTGC1 = PTGC1LIM: Increment the PTGQPTR register.
			PTGC1 ≠ PTGC1LIM: Increment Counter 1 (PTGC1) and copy the values contained in the bits, CMD[0]:OPTION[3:0], to the PTGQPTR register, and jump to that Step queue.

25. 32-Bit Programmable Cyclic Redundancy Check (CRC) Generator

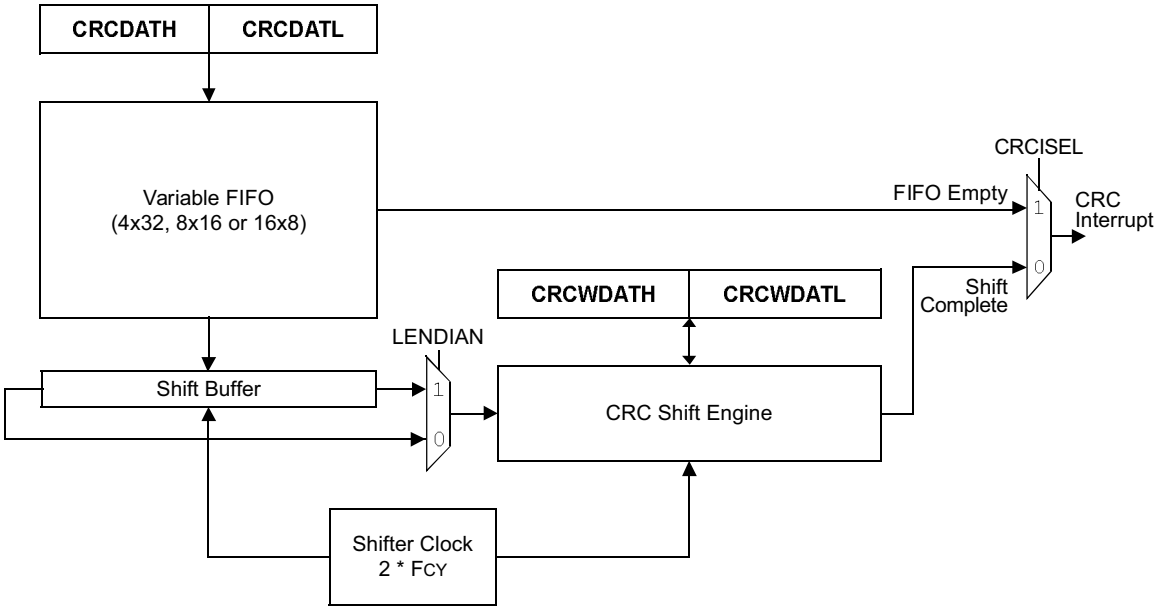

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. For more information, refer to **"32-Bit Programmable Cyclic Redundancy Check (CRC)"** (www.microchip.com/ DS30009729).

The 32-bit programmable CRC generator provides a hardware implemented method of quickly generating checksums for various networking and security applications. It offers the following features:

- User-Programmable CRC Polynomial Equation, Up to 32 Bits
- Programmable Shift Direction (little or big-endian)
- Independent Data and Polynomial Lengths
- Configurable Interrupt Output
- Data FIFO

Figure 25-1 displays a simplified block diagram of the CRC generator.

26. Current Bias Generator (CBG)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Current Bias Generator (CBG)"** (www.microchip.com/DS70005253) in the *"dsPIC33/PIC24 Family Reference Manual"*.

The Current Bias Generator (CBG) consists of two classes of current sources: 10 µA and 50 µA sources. The major features of each current source are:

- 10 µA Current Sources:
  - Current sourcing only
  - Up to four independent sources
- 50 µA Current Sources:
  - Selectable current sourcing or sinking
  - Selectable current mirroring for sourcing and sinking

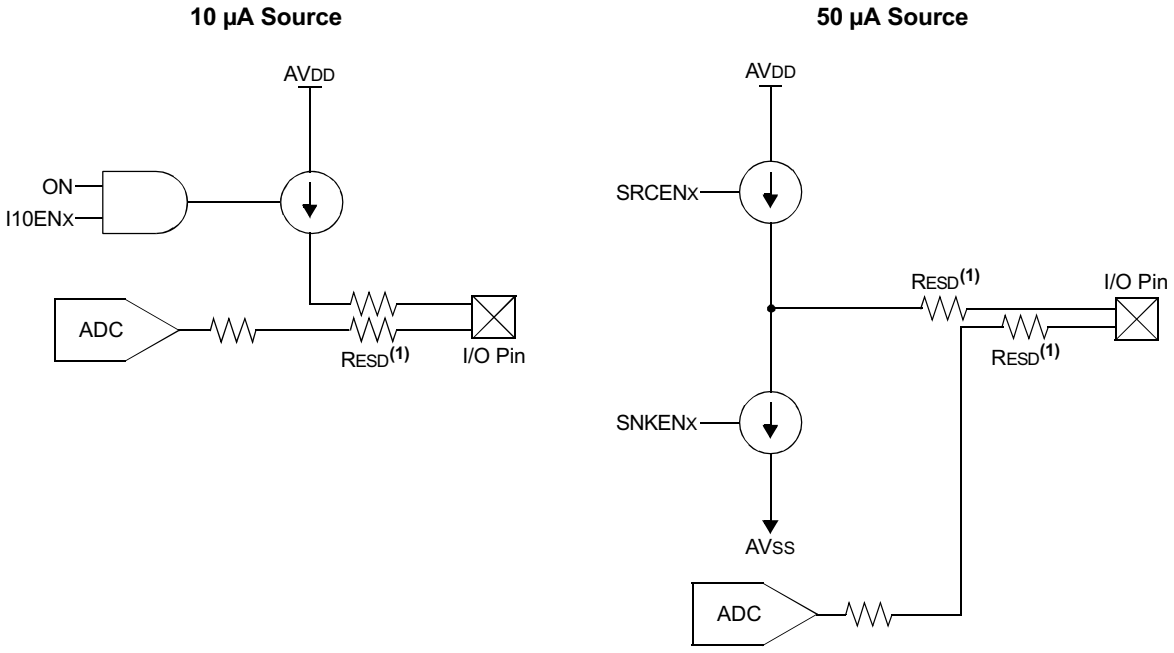

Table 26-1. CBG Channel Availability

Package Type	ISRCx	IBIASx
100-Pin	0,1,2,3	0,1,2,3
80-Pin	0,1,2,3	0,1,2,3

A simplified block diagram of the CBG module is shown in Figure 26-1.

Figure 26-1. Constant-Current Source Module Block Diagram(2)

Notes:

1. RESD is typically 350 Ohms.
2. The ADC analog input is shown only for clarity. Each analog peripheral connected to the pin has a separate Electrostatic Discharge (ESD) resistor.

27. Operational Amplifier

Note: Some device variants support only two op amp instances. Refer to dsPIC33CK1024MP710 Product Families for availability.

The dsPIC33CK1024MP710 family implements three instances of operational amplifiers (op amps). The op amps can be used for a wide variety of purposes, including signal conditioning and filtering. The three op amps are functionally identical. The block diagram for a single amplifier is shown in Figure 27-1.

Figure 27-1. Single Operational Amplifier Block Diagram

The op amps are controlled by two SFR registers: AMPCON1L and AMPCON1H. They remain in a Low-Power state until the AMPON bit is set. Each op amp can then be enabled independently by setting the corresponding AMPENx bit (x = 1, 2, 3).

The NCHDISx bit provides some flexibility regarding input range versus Integral Nonlinearity (INL). When NCHDISx = 0 (default), the op amps have a wider input voltage range (see 33.2. AC Characteristics and Timing Parameters in 33. Electrical Characteristics). When NCHDISx = 1, the wider input range is traded for improved INL performance (lower INL).

28. Deadman Timer (DMT)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Deadman Timer (DMT)"** (www.microchip.com/DS70005155).

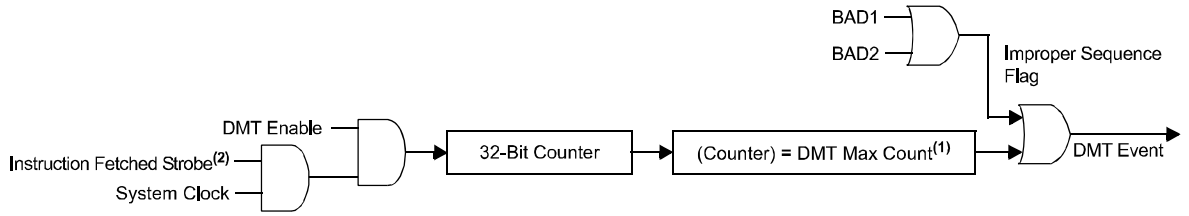

The primary function of the Deadman Timer (DMT) is to interrupt the processor in the event of a software malfunction. The DMT, which works on the system clock, is a free-running instruction fetch timer, which is clocked whenever an instruction fetch occurs, until a count match occurs. Instructions are not fetched when the processor is in Sleep mode.

DMT can be enabled in the Configuration fuse or by software in the DMTCON register by setting the ON bit. The DMT consists of a 32-bit counter with a time-out count match value, as specified by the two 16-bit Configuration Fuse registers: FDMTCNTL and FDMTCNTH.

A DMT is typically used in mission-critical and safety-critical applications, where any single failure of the software functionality and sequencing must be detected.

Figure 28-1 shows a block diagram of the Deadman Timer module.

Figure 28-1. Deadman Timer Block Diagram

Notes:

1. DMT Max Count is controlled by the initial value of the FDMTCNTL and FDMTCNTH Configuration registers.
2. DMT window interval is controlled by the value of the FDMTIVTL and FDMTIVTH Configuration registers.

29. Power-Saving Features

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Watchdog Timer and Power-Saving Modes"** (www.microchip.com/DS70615).

The dsPIC33CK1024MP710 family devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of peripherals being clocked constitutes lower consumed power.

dsPIC33CK1024MP710 family devices can manage power consumption in four ways:

- Clock Frequency
- Instruction-Based Sleep and Idle modes
- Software-Controlled Doze mode
- Selective Peripheral Control in Software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

29.1 Clock Frequency and Clock Switching

The dsPIC33CK1024MP710 family devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSCx bits (OSCCON[10:8]). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in 9. Oscillator with High-Frequency PLL.

29.2 Instruction-Based Power-Saving Modes

The dsPIC33CK1024MP710 family devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembler syntax of the PWRSAV instruction is shown in Example 29-1 and Example 29-2.

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to "wake-up".

Example 29-1. PWRSAV Instruction Syntax in Assembly

```
PWRSAV #SLEEP_MODE    ; Put the device into Sleep mode
PWRSAV #IDLE_MODE     ; Put the device into Idle mode
```

Example 29-2. PWRSAV Instruction Syntax in C Language

```
Sleep()    // Put the device into Sleep mode
Idle ()    // Put the device into Idle mode
```

© 2022-2023 Microchip Technology Inc. and its subsidiaries

29.2.1 Sleep Mode

The following occurs in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep or Idle mode.
- Some device features or peripherals can continue to operate. This includes items such as the Input Change Notification on the I/O ports or peripherals that use an External Clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device wakes up from Sleep mode on any of these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

For optimal power savings, the internal regulator and the Flash regulator can be configured to go into standby when Sleep mode is entered by clearing the VREGS (RCON[8]) bit (default configuration).

If the application requires a faster wake-up time and can accept higher current requirements, the VREGS (RCON[8]) bit can be set to keep the internal regulator and the Flash regulator active during Sleep mode. The available Low-Power Sleep modes are shown in Table 29-1. Additional regulator information is available in 30.5. On-Chip Voltage Regulators.

Table 29-1. Low-Power Sleep Modes

Relative Power	LPWREN	VREGS	Mode
Highest	0	1	Full power, active
—	0	0	Full power, standby
—	1(1)	1	Low power, active
Lowest	1(1)	0	Low power, standby

Note:

1. Low-Power modes, when LPWREN = 1, can only be used in the industrial temperature range.

29.2.2 Idle Mode

The following occurs in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see 29.4. Peripheral Module Disable).

The device wakes up from Idle mode on any of these events:

- Any interrupt that is individually enabled
- Any device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (two to four clock cycles later), starting with the instruction following the `PWRSAV` instruction or the first instruction in the ISR.

© 2022-2023 Microchip Technology Inc. and its subsidiaries

All peripherals also have the option to discontinue operation when Idle mode is entered to allow for increased power savings. This option is selectable in the control register of each peripheral; for example, the SIDL bit in the Timer1 Control register (T1CON[13]).

29.2.3 Interrupts Coincident with Power Save Instructions

Any interrupt that coincides with the execution of a `PWRSAV` instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

29.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, this cannot be practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV[11]). The ratio between peripheral and core clock speed is determined by the DOZE[2:0] bits (CLKDIV[14:12]). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU is not in Idle, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (CLKDIV[15]). By default, interrupt events have no effect on Doze mode operation.

29.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a Minimum Power Consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers do not have any effect and read values are invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note: If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

30. Special Features

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section of the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip website (www.microchip.com).

The dsPIC33CK1024MP710 family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation
- Brown-out Reset (BOR)

30.1 Configuration Bits

In dsPIC33CK1024MP710 family devices, the Configuration Words are implemented as volatile memory. This means that configuration data will get loaded to volatile memory (from the Flash Configuration Words) each time the device is powered up. Configuration data are stored at the end of the on-chip program memory space, known as the Flash Configuration Words. Their specific locations are shown in Table 30-1. The configuration data are automatically loaded from the Flash Configuration Words to the proper Configuration Shadow registers during device Resets.

When creating applications for these devices, users should always specifically allocate the location of the Flash Configuration Words for configuration data in their code for the compiler. This is to make certain that program code is not stored in this address when the code is compiled. Program code executing out of configuration space will cause a device Reset.

Note: Performing a page erase operation on the last page of program memory clears the Flash Configuration Words.

30.3 Device Calibration and Identification

The dsPIC33CK1024MP710 devices have two Identification registers, near the end of configuration memory space, that store the Device ID (DEVID) and Device Revision (DEVREV). These registers are used to determine the mask, variant and manufacturing information about the device. These registers are read-only and are shown in 30.3.2. DEVID and 30.3.1. DEVREV.

30.4 User OTP Memory

The dsPIC33CK1024MP710 family devices contain 64 One-Time-Programmable (OTP) double words, located at addresses, 801700h through 8017FEh. Each 48-bit OTP double word can only be written one time. The OTP Words can be used for storing checksums, code revisions, manufacturing dates, manufacturing lot numbers or any other application-specific information.

The OTP area is not cleared by any erase command. This memory can be written only once.

30.5 On-Chip Voltage Regulators

dsPIC33CK1024MP710 family devices have a capacitorless internal voltage regulator to supply power to the core at 1.2V (typical).

The regulators have Low-Power and Standby modes for use in Sleep modes. For additional information about Sleep, see 29.2.1. Sleep Mode.

When the regulators are in Low-Power mode (LPWREN = 1), the power available to the core is limited. Before the LPWREN bit is set, the device should be placed into a Lower Power state by disabling peripherals and lowering CPU frequency (e.g., 8 MHz FRC without PLL).

30.6 Brown-out Reset (BOR)

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated supply voltage. The main purpose of the BOR module is to generate a device Reset when a Brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse which resets the device. The BOR selects the clock source based on the device Configuration bit selections.

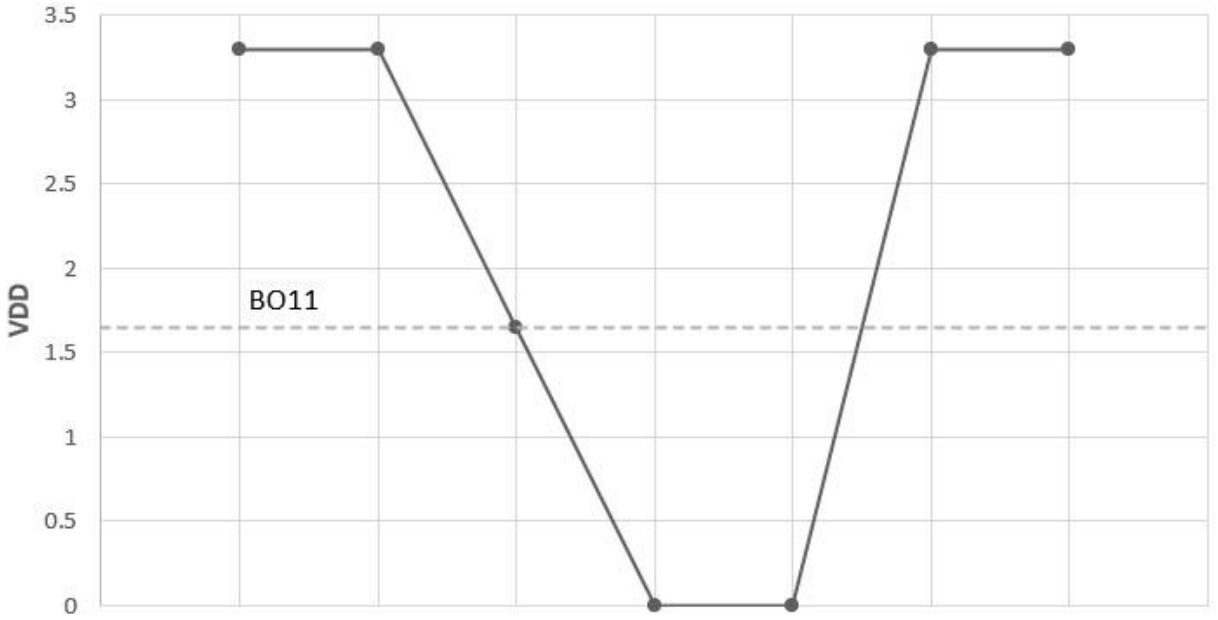

If an Oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON[5]) is '1'.

The BOR status bit (RCON[1]) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle mode and resets the device should V_{DD} fall below the BOR threshold voltage.

If V_{DD} is between V_{BOR} - 25 mV and V_{BOR}, a BOR reset may repeatedly occur. However, while operating at a V_{DD} between 3 - 3.6V, the device will operate as expected. A tristate IO can be used to observe this behavior. The V_{BOR} specification is listed in the Electrical Characteristic section. An external voltage monitor IC may be used to avoid this behavior. MCP111-300E and similar devices are recommended for this purpose.

Figure 30-1. POR Event on V_{DD}

Note: if V_{DD} drops below BO11 value in Table 33-19, V_{DD} must be brought down to 0V before ramping the device back up to operation range.

30.7 Dual Watchdog Timer (WDT)

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Dual Watchdog Timer"** (www.microchip.com/DS70005250).

The dsPIC33 Dual Watchdog Timer (WDT) is described in this section. Refer to Figure 30-2 for a block diagram of the WDT.

The WDT, when enabled, operates from the internal Low-Power RC Oscillator clock source or a selectable clock source in Run mode. The WDT can be used to detect system software malfunctions by resetting the device if the WDT is not cleared periodically in software. The WDT can be configured in Windowed mode or Non-Windowed mode. Various WDT time-out periods can be selected using the WDT postscaler. The WDT can also be used to wake the device from Sleep or Idle mode (Power Save mode). If the WDT expires and issues a device Reset, the WDTO bit in the RCON register will be set.

While the device is reading/writing and executing code from the same Flash Partition, the WDT is intended to stall during this operation and resume its counter after reading/writing from the Flash Partition is complete.

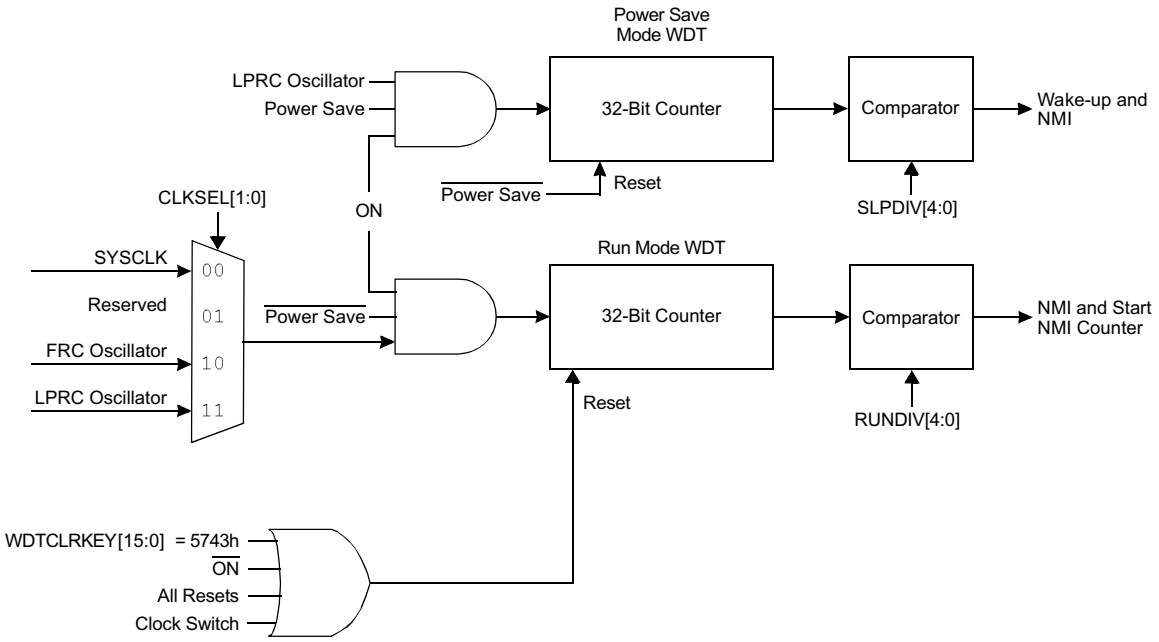

The following are some of the key features of the WDT modules:

- Configuration or Software Controlled
- Separate User-Configurable Time-out Periods for Run and Sleep or Idle mode
- Can Wake the Device from Sleep or Idle mode
- User-Selectable Clock Source in Run mode
- Operates from LPRC in Sleep or Idle mode

Note: In Run mode, the WDT counter will pause during NVM operations and resume after NVM programming.

Notes:

1. A read of this bit will result in a '1' if the WDT is enabled by the device configuration or by software. The user's software should not read or write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
2. The user's software should not read or write the peripheral's SFRs in the SYSCLK cycle immediately following the instruction that clears the module's ON bit.
3. These bits reflect the value of the Configuration bits.
4. The WDTWINEN bit reflects the status of the Configuration bit if the bit is set. If the bit is cleared, the value is controlled by software.
5. The available clock sources are device-dependent.

30.8 JTAG Interface

The dsPIC33CK1024MP710 family devices implement a JTAG interface, which supports boundary scan device testing. Programming is not supported through the JTAG interface; only boundary scan is supported.

Note: Refer to **"Programming and Diagnostics"** (www.microchip.com/DS70608) for further information on usage, configuration and operation of the JTAG interface.

30.9 In-Circuit Debugger

When MPLAB® ICD 3 or the REAL ICE™ emulator is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGCx (Emulation/Debug Clock) and PGDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGC1 and PGD1 Host Debug or Client Debug.
- PGC2 and PGD2 Host Debug or Client Debug.
- PGC3 and PGD3 Host Debug or Client Debug for debugging Host and Client simultaneously; two ICD or the REAL ICE™ emulator are required. This mode of debugging, where the Host and Client are simultaneously debugged, is called the Dual Debug mode.

To use the in-circuit debugger function of the device, the design must implement ICSP connections to $\overline{MCLR}$, V_{DD}, V_{SS} and the PGCx/PGDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two or five (in Dual Debug mode) I/O pins (PGCx and PGDx).

30.10 Code Protection and CodeGuard™ Security

dsPIC33CK1024MP710 family devices offer multiple levels of security for protecting individual intellectual property. The program Flash protection can be broken up into three segments: Boot Segment (BS), General Segment (GS) and Configuration Segment (CS). Boot Segment has the highest security privilege and can be thought to have limited restrictions when accessing other segments. General Segment has the least security and is intended for the end user system code. Configuration Segment contains only the device user configuration data, which are located at the end of the program memory space.

The code protection features are controlled by the Configuration registers, FSEC and FBSLIM. The FSEC register controls the code-protect level for each segment and if that segment is write-protected. The size of BS and GS will depend on the BSLIM[12:0] bits setting and if the Alternate Interrupt Vector Table (AIVT) is enabled. The

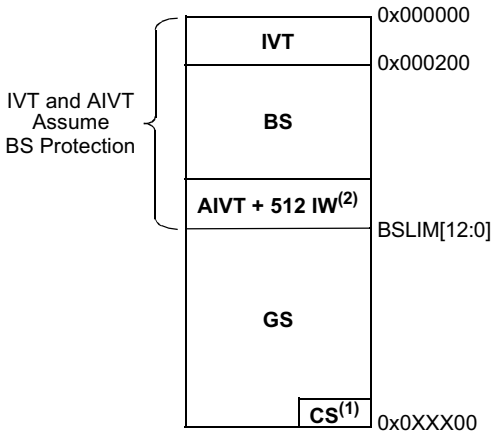

© 2022-2023 Microchip Technology Inc. and its subsidiaries

BSLIM[12:0] bits define the number of pages for BS, with each page containing 1024 IW. The smallest BS size is one page, which will consist of the Interrupt Vector Table (IVT) and 512 IW of code protection.

If the AIVT is enabled, the last page of BS will contain the AIVT and will not contain any BS code. With AIVT enabled, the smallest BS size is now two pages (2048 IW), with one page for the IVT and BS code, and the other page for the AIVT. Write protection of the BS does not cover the AIVT. The last page of BS can always be programmed or erased by BS code. The General Segment will start at the next page and will consume the rest of program Flash, except for the Flash Configuration Words. The IVT will assume GS security only if BS is not enabled. The IVT is protected from being programmed or page erased when either security segment has enabled write protection.

The different device security segments are shown in Figure 30-3. Here, all three segments are shown, but are not required. If only basic code protection is required, then GS can be enabled independently or combined with CS, if desired.

Figure 30-3. Security Segments Example

Notes:

1. If CS is write-protected, the last page (GS + CS) of program memory will be protected from an Erase condition.
2. The last half (256 IW) of the last page of BS is unusable program memory.

31. Instruction Set Summary

Note: This data sheet summarizes the features of the dsPIC33CK1024MP710 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the related section in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip website (www.microchip.com).

The dsPIC33CK instruction set is almost identical to that of the dsPIC30F and dsPIC33F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 31-1 lists the general symbols used in describing the instructions.

The dsPIC33 instruction set summary in Table 31-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register 'Wb' without any address modifier
- The second source operand, which is typically a register 'Ws' with or without an address modifier
- The destination of the result, which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value 'f'
- The destination, which could be either the file register 'f' or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register 'Wb' without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register 'Wd' with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)

© 2022-2023 Microchip Technology Inc. and its subsidiaries

- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write-back destination

© 2022-2023 Microchip Technology Inc. and its subsidiaries

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register 'Wn' or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

Most instructions are a single word. Certain double-word instructions are designed to provide all the required information in these 48 bits. In the second word, the eight MSbs are '0's. If this second word is executed as an instruction (by itself), it executes as a NOP.

The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true or the Program Counter is changed as a result of the instruction, or a PSV or Table Read is performed. In these cases, the execution takes multiple instruction cycles, with the additional instruction cycle(s) executed as a NOP. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note: For more details on the instruction set, refer to the *"16-Bit MCU and DSC Programmer's Reference Manual"* (www.microchip.com/DS70000157).

Table 31-1. Symbols Used in Opcode Descriptions

Field	Description
#text	Means literal defined by "text"
(text)	Means "content of text"
[text]	Means "the location addressed by text"
{ }	Optional field or operation
a ∈ {b, c, d}	a is selected from the set of values b, c, d
[n:m]	Register bit field
.b	Byte mode selection
.d	Double-Word mode selection
.S	Shadow register select
.w	Word mode selection (default)
Acc	One of two accumulators {A, B}
AWB	Accumulator Write-Back Destination Address register ∈ {W13, [W13]+ = 2}
bit4	4-bit bit selection field (used in word-addressed instructions) ∈ {0...15}
C, DC, N, OV, Z	MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address ∈ {0x0000...0x1FFF}
lit1	1-bit unsigned literal ∈ {0,1}
lit4	4-bit unsigned literal ∈ {0...15}
lit5	5-bit unsigned literal ∈ {0...31}
lit8	8-bit unsigned literal ∈ {0...255}
lit10	10-bit unsigned literal ∈ {0...255} for Byte mode, {0:1023} for Word mode
Note: In dsPIC33CK1024MP710 devices, read and Read-Modify-Write (RMW) operations on non-CPU Special Function Registers require an additional cycle when compared to dsPIC30F, dsPIC33F, PIC24F and PIC24H devices.

32. Development Support

Move a design from concept to production in record time with Microchip's award-winning development tools. Microchip tools work together to provide state of the art debugging for any project with easy-to-use Graphical User Interfaces (GUIs) in our free MPLAB® X and Atmel Studio Integrated Development Environments (IDEs), and our code generation tools. Providing the ultimate ease-of-use experience, Microchip's line of programmers, debuggers and emulators work seamlessly with our software tools. Microchip development boards help evaluate the best silicon device for an application, while our line of third party tools round out our comprehensive development tool solutions.

Microchip's MPLAB X and Atmel Studio ecosystems provide a variety of embedded design tools to consider, which support multiple devices, such as PIC® MCUs, AVR® MCUs, SAM MCUs and dsPIC® DSCs. MPLAB X tools are compatible with Windows®, Linux® and Mac® operating systems while Atmel Studio tools are compatible with Windows.

33. Electrical Characteristics

This section provides an overview of the dsPIC33CK1024MP710 family electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33CK1024MP710 family are listed below. Exposure to these Maximum Rating conditions for extended periods may affect device reliability. Functional operation of the device at these, or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Table 33-1. Absolute Maximum Ratings(1)

Ambient temperature under bias	-40°C to +125°C
Storage temperature	-65°C to +150°C
Voltage on V_{DD} with respect to V_{SS}	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to V_{SS}(3)	-0.3V to (V_{DD} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} \geq 3.0V$(3)	-0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} < 3.0V$(3)	-0.3V to +3.6V
Maximum current out of V_{SS} pin	300 mA
Maximum current into V_{DD} pin(2)	300 mA
Maximum current sunk/sourced by any 4x I/O pin	15 mA
Maximum current sunk/sourced by any 8x I/O pin	25 mA
Maximum current sunk by a group of I/Os between two V_{SS} pins(4)	75 mA
Maximum current sourced by a group of I/Os between two V_{DD} pins(4)	75 mA
Maximum current sunk by all ports(2)	200 mA

Notes:

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those, or any other conditions above those indicated in the operation listings of this specification, is not implied. Exposure to Maximum Rating conditions for extended periods may affect device reliability.
2. Maximum allowable current is a function of device maximum power dissipation (see 33.1. DC Characteristics.
3. See the Pin Diagrams sections for the 5V tolerant pins.
4. Not applicable to AV_{DD} and AV_{SS} pins.

Notes:

1. Device is functional at $V_{BORMIN} < V_{DD} < V_{DDMIN}$. Analog modules (ADC and comparators) may have degraded performance.
2. Parameters are characterized but not tested.
3. If V_{DD} drops below BO11 value, V_{DD} must be brought down to 0V before ramping the device back up to operation range.

Note:

1. I_{DD} is primarily a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption.
   Base Run current (I_{DD}) is measured as follows:
   - Oscillator is switched to EC+PLL mode in software
   - OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to V_{DD} – 0.3V
   - OSC2 is configured as an I/O in the Configuration Words (OSCIOFNC (FOSC[2]) = 0)
   - FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
   - Watchdog Timer is disabled (FWDT[15] = 0 and WDTCONL[15] = 0)
   - All I/O pins (except OSC1) are configured as outputs and driving low
   - No peripheral modules are operating or being clocked (defined PMDx bits are all '1's)
   - JTAG is disabled (JTAGEN (FICD[5]) = 0)
   - `NOP` instructions are executed in `while(1)` loop

Notes:

1. Data in the "Typ." column are for design guidance only and are not tested.
2. Base Idle current (I_{IDLE}) is measured as follows:
   - Oscillator is switched to EC+PLL mode in software
   - OSC1 pin is driven with external 8 MHz square wave with levels from 0.3V to V_{DD} – 0.3V
   - OSC2 is configured as an I/O in the Configuration Words (OSCIOFNC (FOSC[2]) = 0)
   - FSCM is disabled (FCKSM[1:0] (FOSC[7:6]) = 01)
   - Watchdog Timer is disabled (FWDTEN (FWDT[15]) = 0)
   - All I/O pins (except OSC1) are configured as outputs and driving low
   - No peripheral modules are operating or being clocked (defined PMDx bits are all '1's)
   - JTAG is disabled (JTAGEN (FICD[5]) = 0)
   - Flash in standby with NVMSIDL (NVMCON[12]) = 1

Notes:

1. Data in the "Typ." column are for design guidance only and are not tested.
2. I_{PD} (Sleep) current is measured as follows:
   - CPU core is off, oscillator is configured in EC mode and External Clock is active; OSCI is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
   - CLKO is configured as an I/O input pin in the Configuration Word
   - All I/O pins are configured as output low
   - $\overline{MCLR}$ = V_{DD}, WDT and FSCM are disabled
   - All peripheral modules are disabled (PMDx bits are all set)
   - The VREGS bit (RCON[8]) = 0 (i.e., core regulator is set to standby while the device is in Sleep mode)
   - JTAG is disabled
3. The regulators are in High-Power mode, LPWREN (VREGCON[15]) = 0.

			10	—	32	MHz	HS
OS20	T_{OSC}	$T_{OSC} = 1/F_{OSC}$	15.6	—	DC	ns	

Notes:

1. Data in "Typ." column are at 3.3V, +25°C unless otherwise stated.
2. Instruction cycle period (T_{CY}) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "Minimum" values with an External Clock applied to the OSCI pin. When an External Clock input is used, the "Maximum" cycle time limit is "DC" (no clock) for all devices.
3. Measurements are taken in EC mode. The CLKO signal is measured on the OSCO pin.
4. This parameter is characterized but not tested in manufacturing.

Notes:

1. Data in "Typ." column are at 3.3V, +25°C unless otherwise stated.
2. Instruction cycle period (T_{CY}) equals two times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type, under standard operating conditions, with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "Minimum" values with an External Clock applied to the OSCI pin. When an External Clock input is used, the "Maximum" cycle time limit is "DC" (no clock) for all devices.
3. Measurements are taken in EC mode. The CLKO signal is measured on the OSCO pin.

34. High-Temperature Electrical Characteristics

This section provides an overview of the dsPIC33CK1024MP710 family devices operating in an ambient temperature range of -40°C to +150°C.

The specifications between -40°C to +150°C are identical to those shown in 34.1. DC Characteristics for operation between -40°C to +125°C, with the exception of the parameters listed in this section. Parameters in this section begin with an H, which denotes High temperature.

Absolute maximum ratings for the dsPIC33CK1024MP710 family high-temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device, at these or any other conditions above the parameters indicated in the operation listings of this specification, is not implied.

Table 34-1. Absolute Maximum Ratings(1)

Ambient temperature under bias	-40°C to +150°C
Storage temperature	-65°C to +150°C
Voltage on V_{DD} with respect to V_{SS}	-0.3V to +4.0V
Voltage on any pin that is not 5V tolerant with respect to V_{SS}(3)	-0.3V to (V_{DD} + 0.3V)
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} \geq 3.0V$(3)	-0.3V to +5.5V
Voltage on any 5V tolerant pin with respect to V_{SS} when $V_{DD} < 3.0V$(3)	-0.3V to +3.6V
Maximum current out of V_{SS} pin	300 mA
Maximum current into V_{DD} pin(2)	300 mA
Maximum current sunk/sourced by any 4x I/O pin	15 mA
Maximum current sunk/sourced by any 8x I/O pin	25 mA
Maximum current sunk by a group of I/Os between two V_{SS} pins(4)	75 mA
Maximum current sourced by a group of I/Os between two V_{DD} pins(4)	75 mA
Maximum current sunk by all I/Os(2)	200 mA
Maximum current sourced by all I/Os(2)	200 mA

Notes:

1. Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those, or any other conditions above those indicated in the operation listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
2. Maximum allowable current is a function of device maximum power dissipation (see 34.1. DC Characteristics.
3. See the Pin Diagrams section for the 5V tolerant pins.
4. Not applicable to AV_{DD} and AV_{SS} pins.

36. Revision History

Revision A (April 2022)

This is the initial version of the document.

Revision B (May 2022)

This revision incorporates the following updates:

- Sections:
  - Changed the first bullet in the **Peripheral Features** section to **Three** Quadrature Encoder Interfaces (QEIs).
  - Changed the sixth bullet in the **Safety Features** section to **Flash OTP by ICSP™ Write Inhibit.**
  - Updated **1. Device Overview** and **2. Guidelines for Getting Started with High-Performance Digital Signal Processors.**
  - Updated document title to **High-Performance Digital Signal Controllers with High-Resolution PWM and CAN Flexible Data-Rate (CAN FD).**
- Tables:
  - Updated **Table 13-1: External Input Availability, Table 34-6. DC Characteristics: Operating Current (I_{DD}), Table 34-7. Idle Current (I_{IDLE}), Table 34-8. DC Characteristics: Power-Down Current (I_{PD}), Table 34-10. DC Characteristics: Watchdog Timer Delta Current (ΔI_{WDT}), Table 34-16. I/O Pin Input Specifications, Table 35-6. DC Characteristics: Operating Current (I_{DD})** and **Table 35-9. DOZE Current (I_{DOZE}).**
  - Added **Table 34-9. DOZE Current (I_{DOZE}), Table 34-15. Op Amp Delta Current** and **Table 35-7: Idle Current (I_{IDLE}).**
  - Removed **Table 34-22. Capacitive Loading Requirements on Output Pins, Table 34-41. Die Temperature Diode Specifications, Table 35-7. DC Characteristics: Operating Current (I_{DD}) (Sleep), Table 35-8. DC Characteristics: Operating Current (I_{DD}) (Run), Table 35-10. DC Characteristics: Idle Current (I_{IDLE}) , Table 35-11. DC Characteristics: Idle Current (I_{IDLE}) (Sleep)** and **Table 35-18. Internal LPRC Accuracy.**
- Registers:
  - Updated **13.4.4 ADC Control Register 2 High.**
  - Added the following registers: **CLC5GLSL-CLC8GLSL, CLC5GLSH-CLC8GLSH, CLC6CONL-CLC8CONL, CLC6CONH-CLC8CONH** and **CLC6SELL-CLC8SELL.**
- Figures
  - Updated **Figure 1. 48-Pin TQFP/VQFN, Figure 2. 64-Pin TQFP, QFN, Figure 3. 80-Pin TQFP, Figure 4. 100-Pin TQFP, Figure 1-1. dsPIC33CK1024MP710 Family Block Diagram, Figure 13-1. ADC Module Block Diagram, Figure 13-2. Shared Core Block Diagram**and **Figure 34-1. Load Conditions for Device Timing Specifications.**

Minor grammatical corrections and formatting changes throughout the document.

Revision C (April 2023)

This revision incorporates the following updates:

- Sections:
  - Changed **Functional Safety Support – ISO 26262/IEC 61508/IEC 60730** title and content.
  - Added new content to the first paragraph in **5.6.1 Flash Partition Swapping.**
  - Added new paragraph to **12.2 Architecture Overview.**
  - Added new paragraph to **30.6 Brown-out Reset (BOR).**
  - Added note to **30.7 Dual Watchdog Timer (WDT).**
- Tables:

© 2022-2023 Microchip Technology Inc. and its subsidiaries

  - Updated **Table 1. dsPIC33CK1024MP710 Motor Control/Power Supply Families with CAN FD**, **Table 2. dsPIC33CK1024MP710 Motor Control/Power Supply Families with No CAN FD**, **Table 5. 80-Pin TQFP**, **Table 8-3. Remappable Pin Inputs**, **Table 8-5. Remappable Output Pin Registers**, **Table 8-6. Output Selection for Remappable Pins (RPn)**, **Table 33-3. Thermal Operating Conditions**, **Table 33-36. UARTx Module I/O Timing Requirements**, **Table 33-39. DACx Module Specifications** and **Table 34-19. DACx Module Specifications.**

- Registers:
  - Updated **3.5.29 Y Page Register**, **7.7.1 Interrupt Request Flags Register 0**, **7.7.14 Interrupt Enable Register 0**, **9.11.1 Oscillator Control Register**, **11.2.1 CAN Control Register Low**, **12.6.8 Auxiliary Combinational Trigger Register Low**, **12.6.9 Auxiliary Combinational Trigger Register High**, **12.6.10 Auxiliary Combinatorial PWM Logic Control Register y**, **12.6.19 Auxiliary PWM Generator xy PCI Register Low**, **12.6.20 Auxiliary PWM Generator xy PCI Register High**, **12.6.22 Auxiliary PWM Generator x Leading-Edge Blanking Register High**, **14.4.4 DACx Control Low Register**, **14.4.8 DAC Slope x Control Low Register**, **22.6.1 CCPx Control 1 Low Register** and **28.1.1 Deadman Timer Control Register.**
  - Changes all instances of PWM, FSMINPER, PG, MPER, PGxPER, PGxPHASE, PGxCAP, PGxCON, PGxTRIG, PGxSTAT, PGxDCA in the Auxiliary PWM section to APWM, AFSMINPER, APG, AMPER, APGxPER, APGxPHASE, APGxCAP, APGxCON, APGxTRIG, APGxSTAT, APGxDCA.

Microchip Information

The Microchip Website

Microchip provides online support via our website at www.microchip.com/. This website is used to make files and information easily available to customers. Some of the content available includes:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQs), technical support requests, online discussion groups, Microchip design partner program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

Product Change Notification Service

Microchip's product change notification service helps keep customers current on Microchip products. Subscribers will receive email notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, go to www.microchip.com/pcn and follow the registration instructions.

Customer Support

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Embedded Solutions Engineer (ESE)
- Technical Support

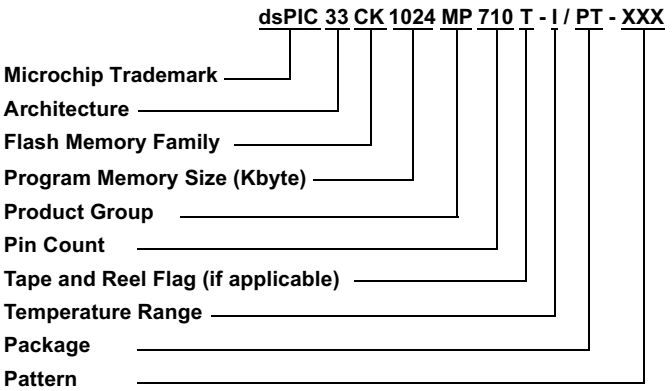

Customers should contact their distributor, representative or ESE for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in this document.

Technical support is available through the website at: www.microchip.com/support

Notes:

1. Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option.
2. Small form-factor packaging options may be available. Please check www.microchip.com/packaging for small-form factor package availability, or contact your local Sales Office.

Microchip Devices Code Protection Feature

Note the following details of the code protection feature on Microchip products:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
- Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is “unbreakable”. Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
